ADVERTIMENT. L'accés als continguts d'aquesta tesi doctoral i la seva utilització ha de respectar els drets de la persona autora. Pot ser utilitzada per a consulta o estudi personal, així com en activitats o materials d'investigació i docència en els termes establerts a l'art. 32 del Text Refós de la Llei de Propietat Intel-lectual (RDL 1/1996). Per altres utilitzacions es requereix l'autorització prèvia i expressa de la persona autora. En qualsevol cas, en la utilització dels seus continguts caldrà indicar de forma clara el nom i cognoms de la persona autora i el títol de la tesi doctoral. No s'autoritza la seva reproducció o altres formes d'explotació efectuades amb finalitats de lucre ni la seva comunicació pública des d'un lloc aliè al servei TDX. Tampoc s'autoritza la presentació del seu contingut en una finestra o marc aliè a TDX (framing). Aquesta reserva de drets afecta tant als continguts de la tesi com als seus resums i índexs.

ADVERTENCIA. El acceso a los contenidos de esta tesis doctoral y su utilización debe respetar los derechos de la persona autora. Puede ser utilizada para consulta o estudio personal, así como en actividades o materiales de investigación y docencia en los términos establecidos en el art. 32 del Texto Refundido de la Ley de Propiedad Intelectual (RDL 1/1996). Para otros usos se requiere la autorización previa y expresa de la persona autora. En cualquier caso, en la utilización de sus contenidos se deberá indicar de forma clara el nombre y apellidos de la persona autora y el título de la tesis doctoral. No se autoriza su reproducción u otras formas de explotación efectuadas con fines lucrativos ni su comunicación pública desde un sitio ajeno al servicio TDR. Tampoco se autoriza la presentación de su contenido en una ventana o marco ajeno a TDR (framing). Esta reserva de derechos afecta tanto al contenido de la tesis como a sus resúmenes e índices.

WARNING. Access to the contents of this doctoral thesis and its use must respect the rights of the author. It can be used for reference or private study, as well as research and learning activities or materials in the terms established by the 32nd article of the Spanish Consolidated Copyright Act (RDL 1/1996). Express and previous authorization of the author is required for any other uses. In any case, when using its content, full name of the author and title of the thesis must be clearly indicated. Reproduction or other forms of for profit use or public communication from outside TDX service is not allowed. Presentation of its content in a window or frame external to TDX (framing) is not authorized either. These rights affect both the content of the thesis and its abstracts and indexes.

FAIG CONSTAR que aquest treball, titulat "Dissecting Intermolecular Gold Catalysis: Application to the Total Synthesis of Rumphellaone A", que presenta Carla Obradors Llobet per a l'obtenció del títol de Doctor, ha estat realitzat sota la meva direcció a l'Institut Català d'Investigació Química i que acompleix els requeriments per poder optar a Menció Internacional.

Tarragona, 13 d'Octubre 2014

El director de la tesi doctoral

UNIVERSITAT ROVIRA I VIRGILI
DISSECTING INTERMOLECULAR GOLD CATALYSIS: APPLICATION TO THE TOTAL SYNTHESIS OF RUMPHELLAONE A. Carla Obradors Llobet
Dipòsit Legal: T 75-2015

En primer lloc, agraeixo al Professor Antonio M. Echavarren l'oportunitat de formar-me en el seu grup a l'Institut Català d'Investigació Química (ICIQ). Li agraeixo les classes, els recursos, els seminaris, les conferències i l'accés a perspectives tan diferents. Per sobre de tot, li agraeixo la llibertat i absoluta confiança que he rebut des del primer dia.

A més, agraeixo a la Sònia Gavaldà i l'Imma Escofet la seva sublim eficiència. També que hagin decidit cuidar-nos a cada un de nosaltres simplement perquè tenen un bon cor. Agraeixo cada un dels seus ànims i somriures.

Agraeixo a tots els membres dels serveis tècnics de l'ICIQ la seva professionalitat i ajuda, en especial a David Pena i Ángel Mosquera d'Informàtica i als de Ressonància Magnètica Nuclear i de Difracció de Raigs X.

Agraeixo als Professors Vladimir Grushin, Rubén Martín, Feliu Maseras, Miquel Pericàs i la gent dels seus grups haver-me obert les portes i compartir el seu punt de vista cada cop que ho he demanat. Agraeixo també les col•laboracions amb Nicholas J. Green del grup del Professor Michael S. Sherburn a la Universitat Nacional d'Austràlia i amb el Doctor Iván Rivilla del grup del Professor Fernando P. Cossío a la Universitat del País Vasc.

Agraeixo a la Fundació ICIQ, Universitat Rovira i Virgili (URV), el projecte europeu ERC, AGAUR i el Ministeri espanyol amb una beca FPU haver-me finançat durant tot aquest temps.

També agraeixo l'oportunitat d'haver realitzat una estada a The Scripps Research Institute (USA). Agraeixo al Doctor Ryan Shenvi haver-me acceptat al seu grup i haver-me ensenyat tant durant aquells mesos. Agraeixo a Alberto Oppedisano, Doctor Sergey Pronin, Steven Crossley, Greg Trebor i Dennis Franco, entre tants d'altres personatges, tota la seva ajuda i amistat. Agraeixo a la Professora Donna Blackmond i als Doctors Erik Plata i Alex O'Brien la seva col-laboració en el meu projecte.

Agraeixo a tots els membres presents i passats del grup Echavarren qualsevol detall que m'hagin pogut ensenyar. Agraeixo al Doctor Paul McGonigal la seva immensa ajuda: la guia, les tècniques i la constant però no abatuda visió crítica del món. Agraeixo als Doctors Beatrice Ranieri, David Leboeuf, Juhannes Aydin, Javier Carreras, Michael Muratore i Laura López el seu granet de sorra. Per sobre de tot, agraeixo a aquells companys que han sigut amics: amb molt d'apreci a Yahui Wang, Anthony Pitaval i Pilar Calleja. També a Madeleine Livendah1, Núria Huguet, Morgane Gaydou, Masha Kirilova, Bart Herlé, Ana Escribano, Elena de Orbe, Ruth Dorel i tota la resta. Last but not least, agraeixo a l'Anna Homs cada dia que hem passat juntes i tots els que vindran.

Agraeixo a Tarragona haver-me acollit durant aquests anys. Per començar, al Doctor Xacobe Couso: agraeixo totes les cerveses, pitis i cafès. Fins i tot agraeixo totes les preguntes difícils que ens acompanyaven. A més, li agraeixo haver-me ensenyat a parlar amb un ordinador i ser capaç de portar a terme càlculs DFT. Amb moltíssim d'amor agraeixo a l'Asraa Ziadi cada moment que he passat amb ella i que mai m'hi hagi faltat un somriure o una abraçada. També agraeixo a totes aquelles persones que m'han fet sentir com a casa: per sobre de tot, Toni Moragas, David Bastida i cada una de les estones que hem passat tots junts al Delta. A la Berta Camafort, Jordi Ampurdanès, Álvaro Guitérrez, Arkaitz Correa, Piotr Jankowski, Andy Chapman, Alex Hamilton, Philipp Reeh, Andrea Henseler, Antonio Bazzo, Yolanda González, Claudio Martínez, Laura Fra, Jose Souto, Carles Rodríguez, Elena Arceo, Manuel Nappi, Paula Álvarez, Francisco Juliá, Anton

Lishchynski, Toni Bautista, Giulia Bergonzini, Charles Goery, Maria Basora, Miriam Sau, el Txepu i la Mariona i tants d'altres. I sobretot, a la senyora Azucena Obdulia del Carrer Sant Domènech.

Finalment, agraeixo a Manresa haver-me fet créixer fins a ser qui sóc avui i que encara ara senti que "ja he tornat" quan avanço Montserrat. Agraeixo a totes les persones que m'han acompanyat, ajudat i animat, cadascú en el seu moment i a la seva manera: a la Gemma Basiana, a la Miriam Raventós, al Josep M. Grané, al Jordi Guixé, a la Laura Fíguls, al Jordi Serra, a la Devi Tarragó, a l'Àstrid García, a la Sònia Cornejo, a l’Òscar Serra, al Victor Vallejo, al Marc Vila, a la Laura Vall, a la Tina Ribas, al Marc Khatib, a la Andrea Navarro, al Jordi Garcés, al Jordi Archs, a la Marta Vilar, al Joan Cantón, a la Txell Pons i a mil més que al recordar-los, em fan somriure. També agraeixo cada una de les converses que he tingut amb el senyor Pere, tot i que preferiria haver-lo conegut en unes altres circumstàncies.

I, per sobre de tot, agraeixo als meus pares, l'Emma i a tota la família l'amor, els consells i el suport incondicional que m'han regalat sempre. Aquesta tesis i la meva persona són obra seva, per haver construït un niu on sempre hi serem acceptats i estimats i per haver-me ensenyat a imitar-los: sempre creuré que són el millor exemple que hauria pogut tenir.

Per acabar, agraeixo haver conegut al Doctor Josep Cornellà: per mi, el Pep. Agraeixo cada una de les estones que hem passat junts: els riures, les discussions, l'ajuda i tot el que n'he pogut aprendre. Espero i desitjo que aquest hagi sigut només el començament del viatge.

En el moment de redactar aquesta memòria, els resultats aquí descrits han donat lloc a les següents publicacions:

This PhD manuscript is preceded by a General Introduction to gold chemistry and its applications. Part of this information was published in the form of reviews: e-EROS Encyclopedia of Reagents in Organic Synthesis (2011), Chemical Communications (2014), Accounts of Chemical Research (2014), Chemistry Asian Journal (2014) and Organic Reactions (2014).

At the same time, each chapter contains an outline with specific examples concerning our findings. Afterwards, the results are presented and discussed leading to the pertinent conclusions. Finally, a general overlook of the doctorate is exposed followed by all the experimental data: complete characterization of all the mentioned substrates, X-Ray crystallographic data and DFT calculations data. The references and numbering are organized by chapters as well.

The work performed during these four years has been divided in five chapters:
Chapter 1 gathers the development of the gold-catalyzed macrocyclization of large enynes via a $[2+2]$ cycloaddition. This work was performed in collaboration with Dr. Juhanned Aydin at the beginning and with Dr. David Leboeuf at the end. I also thank Dr. Paul McGonigal for his guidance. The results were defended as my Master project in 2010 and published in Organic Letters in 2013.

Chapter 2 presents the development of the gold-catalyzed intermolecular cascade $[2+2+2]$ cycloaddition of alkynes with oxoalkenes. I thank the lessons received by Dr. Xacobe Couso in order to perform DFT calculations. The results were published in Chemistry European Journal in 2013.

Chapter 3 contains a mechanistic study of the $[2+2+2]$ cycloaddition, which led to the discovery of digold species. I thank Dr. Josep Cornellà for fruitful discussions. The results were published together with Chapter 2.

Chapter 4 included the design of new gold complexes for the intermolecular reactions accompanied with a mechanistic study of the [2+2] cycloaddition of alkynes with alkenes in order to explain the anion effects. This work was performed together with Anna Homs and in collaboration with Dr. David Leboeuf. The results were published in Advanced Synthesis and Catalysis in 2014.

Chapter 5 collects all the results obtained towards the total synthesis of the natural product Rumphellaone A as well as the attempts of an enantioselecective $[2+2]$ version. This project is currently continued by Dr. Beatrice Ranieri. I thank Dr. Javier Carreras, Dr. Laura López and Dr. Josep Cornellà for crucial suggestions. These results are still unpublished.

In this manuscript, the abbreviations and acronyms most commonly used in organic and organometallic chemistry have been used following the recommendations of "Guidelines for authors" J. Org. Chem. 2006, 71, 1A-11A.

Additionally, we have also used the following ones:

| DFT | Density Functional Theory |
| :--- | :--- |
| ESP | Electrostatic potential |
| Tol | Tolyl |
| DCE | 1,2-Dichloroethane |
| THT | Tetrahydrothiophene |
| BIPHEP | (Biphenyl-2,2'-diyl)bis(diphenylphosphine) |
| TBHP | Tert-butylhydroperoxide |
| DTBB | 4,4'-Di-tert-butylbiphenyl |
| CPME | Cyclopentyl methyl ether |
| iPr-DuPHOS | 1,2-Bis[2,5-diisopropylphospholano]benzene |
| py | Pyridine |
| TsCl | Tosyl chloride |
| DIBAL | Diisobutyl aluminium hydride |
| TBS | Tert-butyldimethylsilyl |
| DIPT | Diisopropyltartrate |
| TMS | Trimethyl silyl |
| DME | Dimethoxyethane |
| TBAF | Tetrabutylammonium fluoride |
| BINAP | 2,2'-Bis(diphenylphosphino)-1,1'-binaphthyl |
| TMBN | 2,4,6-trimethoxybenzonitrile |
| NNf ${ }_{2}^{-}$ | Nonafluorobutanesulfimide |

General Introduction

## Gold as a Catalyst

For centuries, gold was considered a precious, purely decorative noble metal. It was not until 1998, in a groundbreaking report, that the hydration of alkynes catalyzed by $\mathrm{Au}(\mathrm{I})$ complexes under homogeneous conditions was reported. ${ }^{1,2}$ Henceforth, numerous transformations were developed, nourishing the field of organic synthesis. ${ }^{3}$ Gold salts and complexes emerged as powerful catalysts for the selective electrophilic activation of multiple bonds towards a variety of hetero- and carbonucleophiles under mild conditions. Cycloisomerizations and cycloadditions attracted particular attention for the construction of complex polycyclic structures present in diverse natural products. ${ }^{4,5}$ Reactions catalyzed by gold usually proceed by multistep pathways that are rather complex. Although coherent mechanistic proposals advanced by means of DFT calculations, as well as labelling and kinetic experiments, isolation of key intermediates was proven to be challenging. ${ }^{6}$

Figure 1. Gold complexes bearing different ligands.
Although simple gold salts such $\mathrm{NaAuCl}_{4}$ or AuCl were active enough to catalyze many transformations, precatalysts LAuCl bearing phosphine or N -heterocyclic carbene as ligands found more widespread applications. ${ }^{7}$ The active species were often generated in situ by chloride abstraction using a silver salt with distinct anions. However, the innocence

[^0]of silver in the reaction mixture was recently questioned. ${ }^{8}$ The most convenient catalysts are gold complexes [LAuL']X or [LAuX] with weakly coordinating neutral (L') or softer anionic ligands (X), which could enter the catalytic cycle by associative ligand exchange with the substrate (Figure 1). ${ }^{9}$ The properties of the catalysts can be easily tuned sterically or electronically depending on the ligand. Thus, in general, complexes with phosphite (A) and related ligands are more electrophilic than those bearing more donating N -heterocyclic carbenes (C), whereas with phosphines show intermediate electrophilicity (B or $\left.\left[\mathrm{Ph}_{3} \mathrm{PAuNCMe}\right] \mathrm{SbF}_{6}\right) .{ }^{3 \mathrm{~d}}$ The use of chiral ligands led to the development of efficient asymmetric processes. ${ }^{10,11}$

## Activation of Unsaturated Substrates

Important structural features of gold are its aurophilicity, its linear geometry that limits the coordination potential and the fact that it does not undergo spontaneous oxidative addition nor $\beta$-hydride elimination. Gold has the highest electronegativity among the transition metals, which is attributed to relativistic effects. ${ }^{12}$ Hence, the contraction of the 6 s orbital in gold is much more significant than for the rest of the transition metals, which leads to an expansion of the 5d orbital, decreasing its electron-electron repulsion and becoming a remarkably soft Lewis acid. Furthermore, 5d electrons are too low in energy to experience a significant backbonding to anti-bonding orbitals but not to empty non-bonding orbitals. Thus, a 3 center - 4 electron $\sigma$-bond is proposed in gold(I)-carbenes $\left[\mathrm{L}-\mathrm{Au}=\mathrm{CR}_{2}\right]^{+}$ accompanied with orthogonal weak $\pi$-backbonding from the metal to both the ligand and the substrate (Figure 2).

[^1]

Figure 2. Ligand-metal-substrate orbital interactions in gold carbenes.
Gold(I) forms stable monomeric two coordinate $\pi$-complexes with alkenes, ${ }^{13}$ 1,3-dienes, ${ }^{14}$ substituted alkynes ${ }^{15}$ and allenes. ${ }^{16}$ Variations of the bond lengths as well as the ligand-metal-substrate angle suggest that the alkene orientation is controlled largely by steric factors. Thus, terminal alkenes bind unsymmetrically with gold(I) resulting in longer bonds with the substituted carbon atom. The X-ray structure of isobutylene $\operatorname{IPr}$-gold(I) complex $\mathbf{1}$ revealed a $0.086 \AA$ difference between the metal-carbon bonds, whereas for norbornene (2) and 2,3-dimethyl-2-butene (3), this difference is $0.024 \AA$ and $0.009 \AA$, respectively (Figure 3). ${ }^{13 \mathrm{~b}}$ The angle between the metal and the centroid of the alkene also increased with the bulkiness of the alkene: $171.8^{\circ}$ (isobutylene), $174.8^{\circ}$ (norbornene), and $176.8^{\circ}$ (2,3-dimethyl-2-butene).

1

2

3

4

Figure 3. Analysis of alkene and alkyne gold complexes.
Internal alkyne gold(I) complex 4 showed almost symmetrical $\eta^{2}$-coordination. The triple bond length is identical to that of a free alkyne, although there is significant bending back of the alkyl substituents. ${ }^{15 \mathrm{c}}$

In the case of allenes, structural and solution analysis demonstrated that gold(I) preferentially binds to the less substituted $\mathrm{C}=\mathrm{C}$ bond (Scheme 1). Although a theoretical study proposed that $\pi$-coordinated gold(I) complexes 5 with model NHC or phosphite

[^2]ligands could be in rapid equilibrium with $\eta^{1}$-allenyl species $5^{\prime},{ }^{17}$ other experimental results with gold(I) complexes bearing bulky phosphine ligands ruled out the involvement of $5^{\prime}$ in the low energy $\pi$-face exchange processes $\left(\leq 10 \mathrm{kcal} \mathrm{mol}^{-1}\right) .{ }^{16}$

Scheme 1. Proposed equilibrium between $\eta^{2}$-allene (5) and $\eta^{1}$-allenyl ( $5^{\prime}$ ) gold species.

## Nucleophilic Attack

In general, attack of nucleophiles to ( $\eta^{2}$-alkyne)gold(I) complexes $\mathbf{6}$ gives trans-alkenyl species 7 (Scheme 2). ${ }^{3,18}$ Although an outer-sphere mechanism is widely accepted and it has been verified many times in the stereoselectivity of gold(I)-catalyzed reactions, there are few exceptions. Although it is difficult to distinguish an outer-sphere attack from an insertion process, this type of mechanism was suggested in the gold(I)-catalysed hydroamination of alkynes and allenes with ammonia, since coordination to nitrogen was found to be preferred under catalytic condition in the presence of an excess of alkyne when using catalysts as D. 3-Hexyne was transformed to imine $\mathbf{8}$ with an excess of ammonia in toluene at $200{ }^{\circ} \mathrm{C}$ for $20 \mathrm{~h} .{ }^{19}$ The syn-insertion of methyl propiolate in the Au-Si bond of a gold silyl complex was recently demonstrated. ${ }^{20}$

Scheme 2. Anti vs. syn nucleophilic attack to $\pi$-activated alkynes.
A wide range of carbon and heteronucleophiles such as arenes, ${ }^{21}$ heteroarenes, ${ }^{22}$ alcohols, ${ }^{23}$ amines, ${ }^{24}$ imines,,${ }^{25}$ sulfoxides, ${ }^{26} \mathrm{~N}$-oxides ${ }^{27}$ and thiols ${ }^{28}$ have been used as nucleophiles in

[^3]inter- or intramolecular processes. An early example was the intramolecular gold(III)catalyzed cyclization of $\alpha$-hydroxyallenes, such as 9 , that allowed the straightforward synthesis of 2,5 -dihydrofurans like $\mathbf{1 0}$ in $78 \%$ isolated yield under mild conditions (Scheme 3). ${ }^{29}$

Scheme 3. Early gold-catalyzed cyclization of $\alpha$-hydroxyallenes (9).
Noteworthy, the regioselectivity in the cyclization of halogenated allenones as $\mathbf{1 1}$ could be controlled depending on the oxidation state of the catalyst (Scheme 4). ${ }^{30}$ Thus, gold(III) favoured a mechanism in which the ketone is preferentially activated leading to cyclisation with concomitant 1,2-halogen migration through bromonium intermediate $\mathbf{1 2}$ to finally build $\mathbf{1 3}$ whereas gold(I) coordinated to the allene leading to cyclization without halogen migration via 14 to form 15.

## Scheme 4. Regioselective cyclization of halogenated allenone 11 depending on the metal oxidation state.

The intramolecular nucleophilic addition deserves a special mention when the nucleophile is located at the propargylic position. ${ }^{31}$ Thus, propargylic carboxylates as $\mathbf{1 6}$ could undergo 1,2- or 1,3-acyloxy migrations leading to the formation of vinyl gold(I) carbenoid species 17 or allene gold(I) complexes 18, which could be in rapid equilibrium (Scheme 5). ${ }^{32} \mathrm{~A}$ double 1,2 -shift, which also led to $\mathbf{1 8}$, was found to be energetically more favoured than the direct 1,3 -shift, although different substitution at the substrate could significantly influence this preference.

[^4]

## Scheme 5. Key intermediates in the propargylic migration of 16.

Cycloisomerization of $1, n$-enynes are a class of emblematic transformations in which an alkene acts as the nucleophile towards an alkyne activated by gold (see Chapters $\mathbf{1}$ and 2). ${ }^{3 \mathrm{~h}}$ A diverse array of reactions are possible with a significant increase in molecular complexity and in a fully atom economic manner. A representative example was the single-cleavage rearrangement of 1,6 -enyne 19 to form the conjugated diene 20 with 2 $\mathrm{mol} \%$ of $\mathrm{Ph}_{3} \mathrm{PAuCl} / \mathrm{AgSbF}_{6}$, which was proposed to proceed through a cyclopropyl gold(I) carbene (21) that could also be viewed as the homoallyl carbocation 21' (Scheme 6). ${ }^{9 b, 33}$ Gold(I) carbene intermediates could also be generated via a gold-catalyzed retro-Buchner reaction of 7 -substituted cycloheptatrienes. ${ }^{34}$

## Scheme 6. Cyclopropyl gold carbene intermediate 21/21' proposed in the cycloisomerization of enynes.

## Gold Intermediates

Although many gold intermediates are too highly reactive to be readily isolated, some progress has been achieved in the observation of few key species. ${ }^{6}$ In general, alkynes are selectively activated by gold(I) in the presence of other functional groups due to a higher reactivity of the $\eta^{2}$-alkyne gold(I) complexes towards nucleophilic attack. ${ }^{35}$ In the case of the reaction between alkynes and alkenes, gold(I) carbenes and gold(I) stabilized carbocations could be conceived as the intermediates (Scheme 6). ${ }^{33}$ An interesting debate, discussed in Chapter 3, was centred on the nature of the gold-carbon bond in complexes type $[\mathrm{LAuCHR}] .{ }^{+36}$ However, spectroscopic or structural data for carbene-like structures of

[^5]relevance in homogeneous catalysis is lacking. ${ }^{17,37}$ The interesting earlier structure of gold(I) carbene 22 showed C-Au length within the range of a single bond between a $\mathrm{sp}^{2}$ carbon atom and the metal while the $\mathrm{C}-\mathrm{N}$ bond was shorter than a typical imine as $\mathbf{2 2}^{\prime}$ (Figure 4). ${ }^{38,39}$ Neverthless, this scaffold is far from the intermediates generated in a catalytic cycle.

Figure 4. Isolated gold carbene 22/22'.

## Evolution of the Gold Intermediates

Subsequently to the gold activation of the unsaturated scaffold and its nucleophilic attack, the intermediates could evolve through many different pathways leading to a huge variety of complex products. ${ }^{3}$ The simplest evolution of the alkenyl gold(I) intermediates is their reaction with an electrophile, most usually by protodeauration regenerating the active catalyst. For example, intermediate 23 reacted with $p$-toluenesulfonic acid at $80^{\circ} \mathrm{C}$ to form 24 (Scheme 7). ${ }^{40}$ Similarly, reaction with iodine and related electrophiles led to the corresponding halo-derivatives as $\mathbf{2 5}$. ${ }^{41}$

Scheme 7. Electrophilic attack to alkenyl gold complex 23.
The alkenyl gold(I) intermediate could further react in numerous multistep processes. ${ }^{42}$ In the case of $1, n$-enynes, they reacted with gold(I) by a series of fascinating rearrangements and related processes in the absence of external or internal nucleophiles (see Chapter 1). ${ }^{9 b, 33 a}$ On the other hand, they reacted both regio- and stereospecifically with a variety of them. ${ }^{21-28}$ As an illustrative example, 1,6 -enyne 26 reacted with $\mathrm{Ph}_{3} \mathrm{PAuMe} / \mathrm{HBF}_{4}$ to form 27 in $80 \%$ isolated yield as a result of the intermolecular anti attack of methanol on the

[^6]cyclopropyl ring intermediate analogous to 21 (Scheme 8). ${ }^{33 a}$

## Scheme 8. Nucleophilic attack of methanol to 1,6-enyne 26.

Carbon nucleophiles reacted by similar mechanistic pathways. ${ }^{43}$ A particular case was illustrated by the cycloaddition of aryl substituted enynes, such as 28 , which reacted readily with cationic gold(I) catalyst $\mathbf{B}$ to form smoothly tricyclic derivative 29 as well through a cyclopropyl gold carbene intermediate (Scheme 9). ${ }^{44}$ This formal [4+2] cycloaddition was stereospecific and, according to DFT calculations, proceeded in a stepwise fashion in which the nucleophilic attack of the $\pi$-activated alkyne was the ratedetermining step.

Scheme 9. [4+2] Cyclization of aryl-substituted 1,6-enyne 28.
Cyclopropyl gold(I) carbene intermediates could also be trapped by carbonyl groups interor intramolecularly as well as with alkenes via cyclopropanation (see Chapters 2 and 3). ${ }^{33,45,46}$ Dienynes such as $\boldsymbol{Z - 3 0}$ bearing an alkoxy group at the propargylic position reacted differently leading to tricyclic products (31) as a result of a cyclization cascade process that involved a formal 1,5-migration of the RO- group (Scheme 10). ${ }^{47}$ Thus, the reaction proceeded through intermediate 32, which evolved by intramolecular attack of the RO- at the electrophilic site of the cyclopropane to form 33. $\alpha, \beta$-Unsaturated gold(I) carbene 34, generated by cleavage of the oxonium bridge, then underwent cyclopropanation with the pending alkene. Intermediate $\mathbf{3 2}$ could also be trapped intermolecularly with an external nucleophile to generate the epimeric derivative 35.

[^7]

Scheme 10. 1,5-Propargylic ether migration of 1,6-enyne Z-30 followed by intramolecular cyclopropanation.

## Intermolecular Processes

Although many transformations were developed using gold catalysis to build complex polycyclic structures, those methodologies generally relied on intramolecular processes. ${ }^{3}$ In contrast, the corresponding intermolecular reactions were found to be more challenging (see the major advances in Chapter 2). ${ }^{48}$ The first gold-catalyzed cycloaddition was developed between alkynes and alkenes to afford a cyclobutene moiety (Scheme 11). ${ }^{49}$ As an example, reaction of ethynylbenzene with $\alpha$-methylstyrene formed cyclobutene 36 when treated with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{SbF}_{6}(\mathbf{E})$ under mild conditions.

Scheme 11. Intermolecular [2+2] cycloaddition of alkynes and alkenes.
Afterwards, the presence of digold(I) complexes with bridging 3 center -2 electron bond were observed in this reaction as well as in many different contexts, which triggered detailed analysis on their involvement in catalysis (see Chapter 3). ${ }^{50,51}$ Moreover, several studies showed that the basicity and coordinating ability of the couteranion also played a

[^8]significant role in the reactivity as well as the selectivity of a specific transformation (see Chapter 4). ${ }^{52}$

## Applications of Gold Chemistry

Therefore, gold-catalyzed reactions show many properties that prove them synthetically very useful. To start, gold chemistry allows a huge increment of the molecular complexity in really diverse types of transformations. ${ }^{3}$ Thus, gold chemistry comprises a set of fully atom economy methodologies that also show excellent regio-, chemo- and stereoselectivities. Furthermore, most reactions proceed under mild conditions, with no additives and with rather robust catalysts. Finally, its reactivity is usually orthogonal to other transition metal catalyzed processes.

For these reasons, gold has been involved in many total syntheses of natural products with pharmaceutical interest (see Chapter 5). ${ }^{53}$ Enantioselective processes are crucial in this area and, although asymmetric control has been shown possible in gold catalysis, there is still room for improvement regarding this specific feature. ${ }^{10,11}$ As an example, a goldcatalyzed cascade $[2+2+2]$ cyclization was used for the stereospecific synthesis of $(-)$ englerin A, which showed activity towards renal cancer cells (Figure 5). ${ }^{54}$

Figure 5. Englerin A synthesized using gold chemistry.

More recently, gold catalysis has also been combined with strong oxidants, ${ }^{55}$ organocatalysts, ${ }^{56}$ palladium, nickel or rhodium ${ }^{57}$ and photoredox reactions ${ }^{58}$ leading to a completely new set of interesting transformations. Finally, heterogeneous gold catalysis as well as the design of nanoparticles have shown great utilities in other contexts, for example, in the activation of small molecules, in supramolecular chemistry or in material science. ${ }^{59}$

## Chapter 1:

## Gold-Catalyzed Macrocyclization of 1,n-Enynes via [2+2] Cycloaddition

## 1. Introduction

As explained in the General Introduction, gold-catalyzed cycloisomerizations of enynes emerged as a powerfull tool for the formation of $\mathrm{C}-\mathrm{C}$ bonds due to the remarkable carbophilic properties of this metal. ${ }^{1}$ These transformations allowed the construction of complex architectures under mild conditions from readily assembled starting materials and later led to the discovery of complex cascade reactions. In the absence of nucleophiles, $1, n$ enynes could form products of skeletal rearrangement in fully intramolecular reactions through discrete cationic intermediates stabilized by gold. ${ }^{2}$

Broadly, gold selectively activates alkynes in the presence of other functional groups forming ( $\pi$-alkyne) gold complexes, which can undergo nucleophilic attack from an alkene. In the case of 1,6 -enyne $\mathbf{1}$, this step formed cyclopropyl gold carbene intermediates $\mathbf{2}$ or $\mathbf{3}$ by an anti-5-exo-dig or a 6 -endo-dig cyclization, respectively (Scheme 1). ${ }^{3}$ These intermediates were highly distorted according to DFT calculations and could later proceed via different pathways depending on the substitution pattern of the alkyne and the alkene.

## Scheme 1. Cyclopropyl gold carbene intermediates from 1,6-enyne 1.

As an example, intermediate 2 could evolve via one step single cleavage rearrangement followed by demetallation in which only the alkene was cleaved. Thus, 1,6-enyne 4 reacted with $2 \mathrm{~mol} \%$ of $\mathrm{Ph}_{3} \mathrm{PAuCl} / \mathrm{AgBF}_{4}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ to build 1,3-diene 5 in $96 \%$ isolated yield after 15 min (Scheme 2). ${ }^{4}$

Scheme 2. Single cleavage rearrangement of 1,6-enyne 4.
On the other hand, 1,6-enyne 6 formed 1,3-diene 7 instead via a double cleavage rearrangement under similar conditions (Scheme 3). ${ }^{4}$ Hence, intermediate 2 generated a

[^10]new rearranged gold carbene (8) by a formal insertion of the terminal alkene carbon into the alkyne carbons. Subsequent $\alpha$-proton elimination formed the final product.

Scheme 3. Double cleavage rearrangement of 1,6-enyne 6.
In the case of intermediate 3, $\alpha$-proton elimination competed with single cleavage rearrangement through intermediate 9 (Scheme 4). ${ }^{5}$ Thus, 1,6-enyne $\mathbf{1 0}$ cyclized in the presence of $2 \mathrm{~mol} \%$ of $\mathrm{Ph}_{3} \mathrm{PAuCl} / \mathrm{AgSbF}_{6}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$ building 1,3-diene 11 in $67 \%$ isolated yield after 20 min .

Scheme 4. Cyclization of 1,6-enyne 10 via 6-endo-dig pathway.
Analogous methodologies using 1,5-enynes were developed as well. ${ }^{6}$ Moreover, similar cycloisomerizations of allenes are also possible. ${ }^{7}$

Alternatively, isomerization of $\mathbf{3}$ by ring expansion of the cyclopropane afforded $97 \%$ of cyclobutene $\mathbf{1 2}$ in the cyclization of 1,6 -enyne $\mathbf{1 3}$ with JohnPhosAuCl/ $\mathrm{AgSbF}_{6}$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ at $-80^{\circ} \mathrm{C}$ (Scheme 5)..$^{8}$ Cyclobutene 12 could be detected spectroscopically by ${ }^{1} \mathrm{H}$ NMR but isomerized to cyclobutene $\mathbf{1 4}$ at $25^{\circ} \mathrm{C}$ in $96 \%$ yield after $15 \mathrm{~min} .{ }^{9}$

Scheme 5. Detection of cyclobutenes 12 and 14.

[^11]Nevertheless, cyclobutenes emerged as the major products with 1,7- or 1,8-enynes. Hence, tricyclic structure 16 was obtained in $80 \%$ isolated yield from the cyclization of 1,7-enyne 15 with $2 \mathrm{~mol} \%$ of [JohnPhosAuNCMe] $\mathrm{SbF}_{6}(\mathbf{B})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25{ }^{\circ} \mathrm{C}$ (Scheme 6). ${ }^{4}$

Scheme 6. Formation of a cyclobutene from 1,7-enyne 15.
Later on, cycloisomerization of 1,8-enynes catalysed by XPhosAuNTf $_{2}(\mathbf{F})$ was developed (Scheme 7). ${ }^{10}$ Thus, 1,8 -enyne $\mathbf{1 7}$ forged cyclobutene $\mathbf{1 8}$ in $90 \%$ isolated yield after 15 min in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ using $4 \mathrm{~mol} \%$ of the mentioned catalyst.

Scheme 7. Formation of a cyclobutene from 1,8-enyne 17.
So far, the largest $1, n$-enyne involved in a gold-catalyzed cycloisomerization was 1,9enyne 19 , which led to 10 -membered ring 20 (Scheme 8 ). ${ }^{11}$ However, this cyclization required $50 \mathrm{~mol} \%$ of the gold catalyst to afford the final product in a moderate yield after 14 h in toluene at $50^{\circ} \mathrm{C}$.

## Scheme 8. Cyclization of 1,9-enyne 19.

On the other hand, the intermolecular [2+2] cycloaddition of terminal alkynes with an excess of an electron-rich alkene occurred using $3 \mathrm{~mol} \%$ of [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{SbF}_{6}(\mathbf{E})$ with a really sterically hindered ligand (Scheme 9). ${ }^{12}$ The reaction proceeded in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ to afford cyclobutene 21 regioselectively from ethynylbenzene and $\alpha$-methylstyrene in $80 \%$ isolated yield.

[^12]Gold-Catalyzed Macrocyclization of 1,n-Enynes via [2+2] Cycloaddition

Scheme 9. Intermolecular [2+2] cycloaddition of alkynes and alkenes.
On the other hand, macrocycles are present in a multitude of important natural products that display a wide variety of biological activities. ${ }^{13}$ Macrocycles are also commonly exploited in the fields of material science ${ }^{14}$ and in supramolecular chemistry. ${ }^{15}$ The most common methods for gaining access to macrocycles involve macrolactonizations, ${ }^{16}$ ringclosing metathesis ${ }^{17}$ or cross-coupling reactions (Figure 1). ${ }^{18}$ For example, in the total synthesis of $(-)$-disorazole $\mathrm{C}_{1}$, a late stage Yamaguchi lactonizaton was used to afford 30membered ring 22 in $79 \%$ isolated yield under mild conditions. ${ }^{19}$ Furthermore, during the synthesis of Taxol, an intramolecular Heck reaction with stoichiometric $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ at $90{ }^{\circ} \mathrm{C}$ afforded 7-membered ring 23 in $49 \%$ yield. ${ }^{20}$

Yamaguchi lactonization
79\%

49\%

Carbonylative Stille reaction
53\%

Olefin metathesis 65\% (E/Z, 2:1)

Figure 1. Examples of macrocyclizations in total synthesis.

[^13](+/-)-2-Epi-jatrophone, which containes a 11-membered ring, was also obtained via an intramolecular carbonylative Stille coupling transformation in $53 \%$ isolated yield. ${ }^{21}$ Finally, in the total synthesis of epothilones A and B, a ruthenium-catalyzed ring-closing olefin metathesis was applied to build 16 -membered ring 24 in $65 \%(E / Z, 2: 1)$ with 50 $\mathrm{mol} \%$ of catalyst loading. ${ }^{22}$

Therefore, the construction of large carbon-based cyclic structures is not synthetically straightforward. Thus, the basic principles underlying the cyclization of bifunctional chain molecules to many-membered rings were expressed in terms of quantitative and systematic relationships applying physical-organic concepts. ${ }^{23}$ The effective molarity, defined as $\mathrm{k}_{\text {Intra }} / \mathrm{k}_{\text {Inter }}$, determined the concentration limit in which a cyclization became favoured in front of polymerization. This factor relied on the type of transformation performed, the substrate involved, the most stable conformation as well as the size of the ring formed. Specifically, 3- to 7-membered rings, reaching the maximum in 5-, were the more straightforward rings formed due to entropic factors whereas it turned rather unfavoured from 8 -membered rings and beyond (Figure 2).

Figure 2. Relationship between the effective molarity in a cyclization and the size of the ring formed.

[^14]
## 2. Objectives

Intramolecular cyclizations of $1,5-, 1,6-, 1,7-$ and 1,8 -enynes were the benchmark to exploit gold-catalyzed reactions. ${ }^{1 \mathrm{~h}}$ Later on, the intermolecular cycloaddition between alkynes and alkenes led to the regioselective formation of cyclobutenes as $21 .{ }^{12}$ Due to the synthetic interest of macrocyclic structures, we reasoned we could develop a new methodology using this transformation. Thus, we decided to attempt the synthesis and gold-catalyzed cyclization of $1, n$-enynes $(n \geq 9) \mathbf{2 5}$ to obtain frameworks such as $\mathbf{2 6}$ (Scheme 10).

## Scheme 10. Gold-catalyzed macrocyclization of $1, n$-enynes ( $n \geq 9$ ).

Therefore, we planned the development of a gold-catalyzed macrocyclization of large enynes as an extension of the intermolecular [2+2] cycloaddition.

## 3. Synthesis of Macrocycles

## Optimization of the [2+2] Cyclization

In contrast to the transformations involving small $1, n$-enynes $(n=5-8)$ that are entropically favoured, obtaining macrocycles from larger $1, n$-enynes ( $n \geq 9$ ) is more challenging. ${ }^{23}$ Preferably, the reacting partners must be in close proximity in a stable conformation to perform the reaction under mild conditions. For example, 1,10-enyne 27 did not lead to the formation of the corresponding macrocycle 28 with $3 \mathrm{~mol} \%$ of catalyst E (Scheme 11). The reaction was attempted in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ and only starting material was recovered after 24 h .

Scheme 21. Need of a spacer in order to react.
To circumvent this problem, we decided to add a spacer to favour the reactivity focusing on 1,14-enyne 29 towards 13 -membered ring 30 (Table 1 ).

We first used catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ but with distinct concentrations, temperatures and reaction times. To start, we could observe that the reaction outcome was highly dependant on the substrate concentration. Thus, when the reaction was performed under concentrated conditions ( 0.3 M ) at $25^{\circ} \mathrm{C}$, the yield of macrocycle $\mathbf{3 0}$ was not higher than $34 \%$ (entry 2 ). Interestingly, too long reaction times showed a decrease of the desired cyclobutene although complete conversion was reached in all cases. On the other hand, decreasing the concentration to 0.07 M and later to 0.007 M led to the formation of macrocycle $\mathbf{3 0}$ in good yields: 53 and $71 \%$, respectively (entries 5 and 15). Nevertheless, the yield dropped to $57 \%$ (diastereoselectivity $2.3: 1$ ) after isolation. Heating the reaction allowed increasing the reaction rate but at the expense of the final yields. Presumably, oligomerization of the enyne or decomposition of the cyclobutene could occur more easily under these reaction conditions. Moreover, applying $10 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ led to macrocycle $\mathbf{3 0}$ only in $64 \%$ yield (entry 22).

Afterwards, alternative gold complexes were examined in the macrocyclization of 1,14enyne 29 to explore the impact of the ligand in the reactivity (Figure 3). The transformation was performed under the optimized conditions and analysed after 1 h (Table 2).

Table 1. Screening of the reaction conditions for the macrocyclization of large enynes.

| Enyne | Concentration (M) | Temperature ( ${ }^{\circ} \mathrm{C}$ ) | Time (h) | Yield ${ }^{\text {a }}$ |

Figure 3. Other complexes screened.

In the case of catalyst $\mathbf{B}$, a direct relationship between the bulkiness around the metal centre and the selectivity was observed. Thus, only $26 \%$ of macrocycle $\mathbf{3 0}$ was obtained with almost complete conversion (entry 1). Compared to complex E, new gold complexes $\mathbf{G}$ and $\mathbf{H}$ did not give macrocycle $\mathbf{3 0}$ in better yields (entries 3, 4 and 5). Study of the intermolecular [2+2] cycloaddition and the single cleavage of 1,6 -enynes revealed the same behaviour for these new catalysts. Moderate results towards the macrocyclization were observed for catalysts $\mathbf{C}$ and $\mathbf{I}$. On the other hand, when the active species were generated in situ from $\mathrm{Ph}_{3} \mathrm{PAuCl} / \mathrm{AgSbF}_{6}$, the reaction proceeded very inefficiently (entry 7). Finally, no macrocycle $\mathbf{3 0}$ was observed using silver or platinum salts or complex [ $\mathbf{P t}^{\mathrm{II}}$ ] (entries 8 to 11). ${ }^{2 \mathrm{a}}$

## Scope of the [2+2] Cyclization

We started by examining the cyclization of 1,9-enyne $\mathbf{1 9}$ towards macrocycle $\mathbf{3 1}$ with catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 12). The reaction was performed with $4 \mathrm{~mol} \%$ at $25^{\circ} \mathrm{C}$ and led to no product, neither with $20 \mathrm{~mol} \%$ at $50{ }^{\circ} \mathrm{C}$. On the contrary, catalyst $\mathbf{B}$ led to complete decomposition.

## Scheme 12. Macrocyclization of 1,9-enynes.

Afterwards, 1,9-enyne 32 was treated with $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $50{ }^{\circ} \mathrm{C}$. Macrocycle 33 was not formed as no reaction was observed after 20 h . The analogous 1,10 -enyne 34 did not lead to macrocycle 35 under the same conditions either (Scheme 13).

Not observed Complex mixture

## Scheme 13. Macrocyclization of 1,10-enynes.

A more flexible 1,10-enyne was synthesized (36) but reaction under the same conditions led to a very complex mixture and no cyclobutene 37 could be observed. In the case of 1,10 -enyne 38 only $19 \%$ of macrocycle 39 was obtained with $77 \%$ of conversion under the optimized conditions. However, the yield increased to $51 \%$ (diastereoselectivity $5: 1$ ) when the concentration was increased to 0.2 M . Cyclization of 1,10 -enyne 40 led to no reaction
under the optimized condition whereas formed macrocycle 41 in $66 \%$ isolated yield when the concentration was increased to 0.2 M and the temperature to $45{ }^{\circ} \mathrm{C}$. Furthermore, 9 -membered ring 41 could be crystallized and the structure confirmed by X-ray diffraction (Figure 4). We could observe that the tetracyclic structure was rather rigid, which led to a distance between the aromatic rings of $2.82 \AA$.

Figure 4. X-Ray crystal structure of macrocycle 41.

On the other hand, 1,11-enyne 42 led to $16 \%$ of macrocycle $\mathbf{4 3}$ and complete conversion under the optimized conditions (Scheme 14). When the reaction was performed in DCE $(0.3 \mathrm{M})$ at $70{ }^{\circ} \mathrm{C}$ the cyclobutene was obtained in $30 \%$ yield after $2 \mathrm{~h}, 20 \%$ (diastereoselectivity $4: 1$ ) after isolation.

Scheme 14. Macrocyclization of 1,11-enyne 42.
In the case of 1,12 -enynes, substrate 44 led to a very complex mixture and no macrocycle 45 was observed (Scheme 15). The reaction was attempted with $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.1 \mathrm{M})$ at 25 and $50^{\circ} \mathrm{C}$ as well as at 0.05 M for 20 h .

Scheme 15. Macrocyclization of 1,12-enynes.
Cyclization of 1,12-enyne 46 afforded macrocycle 47 in $25 \%$ yield when treated with 3 $\mathrm{mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$. Due to co-elution with substrate 46 , the yield of $\mathbf{4 7}$ was determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard. We attempted a subsequent reaction with the crude mixture based on click chemistry,
specifically, a copper-catalyzed Huisgen cycloaddition between the remaining alkyne with a solid supported azide using $10 \mathrm{~mol} \%$ of complex $\left[\mathrm{Cu}^{\mathbf{I}}\right.$ ] (Figure 5). ${ }^{24}$ The reaction was performed in DMF at $80^{\circ} \mathrm{C}$, which led to the triazole but macrocycle $\mathbf{4 7}$ underwent decomposition under these conditions.

Figure 5. Copper catalyst for a Huisgen cycloaddition.
In the case of 1,13 -enyne 48 , a very complex mixture with no cyclobutene 49 was also observed in the reaction with $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at 25 or $50^{\circ} \mathrm{C}$ (Scheme 16). Otherwise, 1,13-enyne $\mathbf{5 0}$ afforded macrocycle $\mathbf{5 1}$ in $\mathbf{1 1 \%}$ yield with complete conversion under the optimized conditions. However, it increased to $29 \%$ isolated yield when the reaction was performed at 0.3 M .

Scheme 16. Macrocyclization of 1,13-enynes.
On the other hand, cyclization of 1,14-enyne $\mathbf{5 2}$ led to macrocycle $\mathbf{5 3}$ in $57 \%$ isolated yield when treated with $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{M})$ at $25^{\circ} \mathrm{C}$ (Scheme 17).

Scheme 17. Macrocyclization of 1,14-enyne 52.

[^15]Afterwards, 1,15-Enyne 54 afforded macrocycle $\mathbf{5 5}$ in $70 \%$ isolated yield under similar conditions (Scheme 18). Therefore, increasing the length of the enyne could lead to better yields as a consequence of a relief in transannular strain.

Scheme 18. Macrocyclization of 1,15-enyne 54.
Nevertheless, 1,16-enyne 56 led to a very complex mixture with no cyclobutene $\mathbf{5 7}$ (Scheme 19).

Scheme 19. Macrocyclization of 1,16-enyne 56.
Similarly, 1,17-enyne 58 formed only traces of macrocycle $\mathbf{5 9}$ when reacted in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at 25 or $50^{\circ} \mathrm{C}$ for 20 h (Scheme 20).

Scheme 20. Macrocyclization of 1,17-enyne 58.
Therefore, in order to explore the scope of the reaction, macrocyclizations were performed with $1,9-$ to 1,17 - enynes bearing different spacers. In general, the reactions were carried out under mild conditions (30) although a few substrates required heating to furnish the macrocyclic products, for example, 41 and 43. In addition, highly diluted conditions were counter-productive in some cases: 39, 47, 51, 53 or 55. Under these conditions, the macrocyclization reaction proceeded in moderate to good yields drastically depending on each substrate: the chain length, the spacer and the substituents.

This methodology also provided access to $m$-cyclophanes. This class of compounds exhibits interesting chemical and physical properties that result from their unusual
architecture. ${ }^{25,26}$ Thus, 1,12-enyne $\mathbf{6 0}$ cyclized to form macrocycle $\mathbf{6 1}$ in $70 \%$ isolated yield with $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.45 \mathrm{M})$ at $25^{\circ} \mathrm{C}$ for 1 day (Scheme 21).

Scheme 21. Macrocyclization of meta-substituted arylenynes.
Finally, cyclization of 1,16-enyne 62 required $5 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ to obtain macrocycle 63 in $71 \%$ isolated yield, which proceeded in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.15 \mathrm{M})$ at $45^{\circ} \mathrm{C}$ for 2 days. Under more diluted conditions, no reaction was observed. Interestingly, macrocycle 61 was obtained as a mixture of atropoisomers $5: 1$ and macrocycle $\mathbf{6 3}, 4: 1$. NMR studies at high temperature $\left(60{ }^{\circ} \mathrm{C}\right.$ ) did not provide further information due to decomposition of the macrocycles. ${ }^{27}$

## Derivatization of the Macrocycles

Finally, we decided to further modify these scaffolds with known transformations in order to prove the synthetic value of the methodology. Attempts of performing a rutheniumcatalyzed ring opening cross-metathesis with ethylene led to no reaction whereas oxidation of the cyclobutene moiety afforded very complex mixtures. ${ }^{28,29}$

Afterwards, we performed the hydrogenation of $\mathbf{3 0}$. The cyclobutene could be reduced with $10 \mathrm{~mol} \%$ of $\mathrm{Pd} / \mathrm{C}$ in methanol at $25^{\circ} \mathrm{C}$ for 8 h under 1 atm of $\mathrm{H}_{2}$ (Scheme 22). Under these conditions debenzylation of $\mathbf{3 0}$ was also observed and compound $\mathbf{6 4}$ was obtained in $79 \%$ isolated yield (diastereoselectivity $2 \cdot 4: 1$ ). Attempts to derivatize the free alcohol with $p$-nitrobenzoyl chloride to crystallize the resulting product failed.

[^16]

79\% isolated, 2.4:1

82\% isolated, 6.0:1.6:1.4:1.0
Scheme 22. Hydrogenation of macrocycle 30.
This problem could be circumvented by the addition of 0.5 equiv. of pyridine under similar conditions to furnish macrocycle $\mathbf{6 5}$ in $82 \%$ isolated yield. ${ }^{30}$ However, this scaffold was obtained as a mixture of diastereoisomers (6.0:1.6:1.4:1.0). The configuration in the cyclobutane ring of the major diastereoisomer was assigned as trans by ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HSQC phase edited, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY NMR spectroscopy.

Furthermore, we compared the stability of the different diastereoisomers of substrates $\mathbf{6 4}$ and 65 by means of DFT calculations. In the case of compound 64, the trans-cyclobutane was the more stable configuration and the effect of the methyl substituent was rather minor, $\mathrm{E}_{\text {CisTrans }}=0.7 \mathrm{kcal} / \mathrm{mol}$ (Figure 6). However, the cis-cyclobutane was significantly less stable, $\mathrm{E}_{\text {TransCis }}=2.6 \mathrm{kcal} / \mathrm{mol}$ and $\mathrm{E}_{\text {CisCis }}=3.3 \mathrm{kcal} / \mathrm{mol}$ than the trans-trans diastereoisomer.

Figure 6. Diastereoisomers of compound 64 (relative energies in kcal/mol).

[^17]On the other hand, macrocycle $\mathbf{6 5}$ was also more stable with a trans cyclobutane (Figure 7). Nevertheless, the effect of the methyl substituent was much more influential: $\mathrm{E}_{\text {CisTrans }}=$ $2.4, \mathrm{E}_{\text {CisCis }}=2.8$ and $\mathrm{E}_{\text {TransCis }}=3.7 \mathrm{kcal} / \mathrm{mol}$.

$65_{\substack{\text { TransTrans } \\ 0.0}}$

## 4. Conclusions

Although a wide variety of gold-catalyzed cycloisomerizations of $1, n$-enynes were developed during the last decade, this class of emblematic transformations were limited from 1,5- to 1,8 -substrates. Construction of larger rings was proven to be challenging due to entropic factors. In here, we have developed a gold-catalyzed macrocyclization of $1, n$ enynes $(n \geq 9)$ via a $[2+2]$ cycloaddition towards a cyclobutene moiety. ${ }^{31}$ As an example, 1,14-enyne 29 led to macrocycle 30 in $57 \%$ isolated yield under highly diluted conditions, at $25^{\circ} \mathrm{C}$ using $3 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ (Scheme 23).

Scheme 23. Macrocyclization under highly diluted conditions.
Nevertheless, these optimized conditions were not general and other substrates required increasing the temperature and/or the concentration in order to react. Thus, 1,10-enyne 40 gave macrocycle 41 in $66 \%$ isolated yield at 0.2 M and $45^{\circ} \mathrm{C}$ (Scheme 24).

Scheme 24. Macrocyclization under harsher conditions.
The gold-catalyzed macrocyclization reaction proceeded smoothly with moderate to good yields forging 8 - to 16 -membered rings, including $m$-cyclophanes. However, the reactivity showed a strong dependence on the structure of each substrate.

## Chapter 2:

Gold(I)-Catalyzed Intermolecular [2+2+2] Cycloaddition of Alkynes and Oxoalkenes

## 1. Introduction

As explained in the General Introduction, gold(I)-catalyzed intramolecular cycloisomerization reactions have been widely studied during the last decade. ${ }^{1}$ Gold(I) complexes have been found to be powerful homogeneous catalysts for carbon-carbon, carbon-oxygen or carbon-nitrogen bond formation proceeding by nucleophilic additions to alkynes, allenes and alkenes giving access to new carbo- and heterocyclic compounds. Despite these major advances, the development of intermolecular cycloadditions using alkynes as the substrates has been shown to be challenging. ${ }^{2}$ In these processes, different unsaturated substrates are involved and their possible competitive binding with the gold complex should be considered. Moreover, gold complexes are inherently acidic and therefore can promote the polymerization of alkenes via cationic mechanisms. ${ }^{3}$

The first intermolecular cycloaddition catalyzed by gold(I) involved terminal alkynes and electronrich alkenes that reacted to form cyclobutenes regioselectively, which are useful building blocks in synthesis (Scheme 1). ${ }^{4}$

Scheme 1. Gold-catalyzed [2+2] cycloaddition of alkynes with alkenes.
This reaction required the use of the sterically hindered gold(I) complex $\left[{ }^{t} \mathrm{BuXPhosAu}\left(\mathrm{NCMe}^{2}\right)\right] \mathrm{SbF}_{6}(\mathbf{E})$ as catalyst, which circumvented the addition of any silver salt. Thus, reaction of ethynylbenzene and $\alpha$-methylstyrene led to the cyclobutene adduct $\mathbf{1}$ in $80 \%$ isolated yield.

Further studies allowed the development of the $[4+2]$ annulation of arylynamides with alkenes using $\operatorname{IPrAuCl} / \mathrm{AgNTf}_{2} .{ }^{5}$ Attack of $p$-methoxystyrene to the activated alkyne 2 followed by a Friedel-Crafts reaction afforded structure $\mathbf{3}$ in $88 \%$ isolated yield (Scheme 2). In contrast, when terminal ynamide 4 and an enol ether were treated with a gold

[^19]complex bearing a phosphine ligand, an intermolecular [2+2+2] reaction took place forming enamine 5 in $73 \%$ isolated yield diastereoselectively.

Scheme 2. Gold-catalyzed [4+2] and [2+2+2] annulation of ynamides with alkenes.
A [4+2] cycloaddition between propargylic esters or carboxylic acids with alkenes was also developed to build $\alpha, \beta$-unsaturated lactones (Scheme 3). ${ }^{6}$ Therefore, tert-butyl propiolate reacted with $\alpha$-methylstyrene and [JohnPhosAuNCMe]SbF ${ }_{6}(\mathbf{B})$ to build lactone 6 in $67 \%$ isolated yield. This transformation was also performed enantioselectively (up to $65 \% \mathrm{ee}$ ), being the first asymmetric example of an intermolecular gold-catalyzed cycloaddition. However, when 1,2-disubstituted alkenes were used, 1,3-dienes were formed stereospecifically by a metathesis-like process.

Scheme 3. Gold-catalyzed [4+2] cycloaddition of propargylic esters with alkenes.
The first intermolecular phenol synthesis was reported using the Schmidbauer-Bayer binuclear gold(I) complex $\left[\left(\mathrm{Mes}_{3} \mathrm{PAu}\right)_{2} \mathrm{Cl}\right] \mathrm{BF}_{4}$ as a catalyst with ethynylbenzene and 2,5dimethylfuran (Scheme 4). ${ }^{7}$

Scheme 4. Gold-catalyzed cycloaddition of alkynes with furans.
Phenol 7 was obtained in $38 \%$ isolated yield, along with large amounts of the hydroarylation product 8. The process was later improved using IPr as ligand (see Chapter 4 for more details). ${ }^{8}$

[^20]Finally, alkynes have been also used intermolecularly as nucleophiles (Scheme 5). ${ }^{9}$ As an example, treatment of a terminal alkyne with gold complex $\mathbf{J}$ underwent deprotonation followed by addition to an imine. ${ }^{10}$ Thus, ethynylbenzene reacted with imine 9 to build the propargylic amine $\mathbf{1 0}$.

## Scheme 5. Gold-catalyzed nucleophilic addition of alkynes to imines.

Besides, a noteworthy intramolecular cascade $[2+2+2]$ reaction between an alkyne, an alkene and a carbonyl group was designed based on the nucleophilic attack towards enynes. ${ }^{11}$ Thus, the cyclization of 1,6 -enyne bearing a carbonyl moiety $\mathbf{1 1}$ using AuCl allowed the formation of tricyclic scaffold $\mathbf{1 2}$ via two $\mathrm{C}-\mathrm{C}$ and one $\mathrm{C}-\mathrm{O}$ bond (Scheme 6 ), ${ }^{12}$ which has been used to build the core of several natural products as $(+)$-orientalol F or $(-)$-englerins A and B. ${ }^{13,14}$ Product $\mathbf{1 2}$ was obtained in $84 \%$ isolated yield (diastereoselectivity $50: 1$ ), together with diene $\mathbf{1 3}$ as a minor by-product.

Scheme 6. Gold-catalyzed [2+2+2] tandem cyclization of an alkyne
and an alkene bearing a carbonyl group.
Thus, the gold catalyst presumably activated preferentially the alkyne of 1,6-enyne 11, which suffered a nucleophilic attack from the alkene (Scheme 7). This step led to the formation of the cyclopropyl gold carbene 14. As discussed before, this intermediate is a highly distorted structure bearing a significant partial positive charge in the cyclopropyl ring. Therefore, it could undergo a subsequent intramolecular nucleophilic attack of the ketone forming a five-membered oxonium cation $\mathbf{1 5}$ stereospecifically. In the presence of

[^21]this alkenyl gold species, the intermediate proceeded through a Prins-type cyclization forming a tertiary carbocation first (16) and the final product 12 after demetallation (orange route). Simultaneous ring opening could explain the formation of the diastereoisomeric tricyclic scaffold $\mathbf{1 2}^{\prime}$ (green route) and the diene product $\mathbf{1 3}$ (blue route).

Scheme 7. Proposed mechanism of the [2+2+2] cyclization.
Trapping of cyclopropyl carbenes with carbonyl groups was also performed using 2 equiv. of an external aldehyde or ketone in the presence of a 1,6-enyne. ${ }^{15,16}$ As an example, 1,6enyne 17 reacted with 1,3,5-trimethylbenzaldehyde and $[\operatorname{IPrAuNCPh}] \mathrm{SbF}_{6}(\mathbf{C})$ to form oxacycle $\mathbf{1 8}$ as the main product (Scheme 8 ).

Scheme 8. Addition of a carbonyl to 1,6-enyne 17.
The transformation progressed at $-40^{\circ} \mathrm{C}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ with retention of the configuration and it was reasoned that this transformation proceeded analogously to the $[2+2+2]$ cyclization. Traces of diene 19 were formed by the competitive ring opening.

[^22]
## 2. Objectives

Considering the challenge when applying a gold-catalyzed intermolecular cycloaddition of an alkyne with an alkene or another functional substrate, we decided to focus on expanding the scope of these methodologies. Furthermore, intermolecular cascade cycloadditions are even scarcer. Although several additions of carbonyls to $1, n$-enynes have emerged successfully, the outcome was rather substrate-dependent leading to mixtures of products and always required the preparation of an elaborate unsaturated scaffold.

Therefore, we decided to attempt the development of an analogous [2+2+2] reaction between an alkyne (20) and an alkene linked to a carbonyl group (21) in an intermolecular fashion to build an oxabicycle scaffold such as 22 (Scheme 9).

Scheme 9. Intermolecular gold-catalyzed [2+2+2] cycloaddition of an alkyne, an alkene and a carbonyl group.

## 3. Synthesis of Oxabicycles

## Optimization of the [2+2+2] Cycloaddition

First, we examined the cycloaddition between ethynylbenzene and 5-methylhex-5-en-2one in 0.5 M of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and at $25{ }^{\circ} \mathrm{C}$ for 24 h to form 23 . We screened several gold complexes as catalysts as well as the effect of the stoichiometry between the alkyne and the oxoalkene (Table 1). A slight excess of alkene was required in the formation of the cyclobutenes as dimerization of $\alpha$-methylstyrene was observed as a competitive sidereaction. ${ }^{4}$ Under these conditions, although the desired oxabicycle was detected using catalyst $\mathbf{A}, \mathbf{B}, \mathbf{C}$ and $\mathbf{E}$, the yields were very low (entries 1 to 4 ).

Table 1. Screening of catalysts for the [2+2+2] cycloaddition.

| Entry | $[\mathbf{A u}]$ | X equiv. | Yield $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: | :---: |
| 1 | $\mathbf{A}$ | 0.5 | $6 \%$ |
| 2 | $\mathbf{B}$ | 0.5 | $19 \%$ |
| 3 | $\mathbf{C}$ | 0.5 | $14 \%$ |
| 4 | $\mathbf{E}$ | 0.5 | $13 \%$ |
| 5 | $\mathbf{B}$ | 2 | $15 \%$ |
| 6 | $\mathbf{C}$ | 2 | $15 \%$ |
| 7 | $\mathbf{E}$ | 2 | $39 \%^{b}$ |
| 8 | $\mathbf{K}$ | 2 | $25 \%$ |
| 9 | $\mathbf{L}$ | 2 | Complex mixture |
| 10 | AuCl | 2 | Complex mixture |
| ${ }^{{ }^{\text {C Crude }} \text { analyzed }}$ by | ${ }^{\mathrm{H}} \mathrm{H}$ NMR | spectroscopy | using |
| 1,4-diacetylbenzene as internal |  |  |  | standard, yields referred to oxabicycle 23. ${ }^{b}$ Isolated yield.

However, the amount of product was increased significantly to $39 \%$ isolated yield of $\mathbf{2 3}$ with catalyst $\mathbf{E}$ by switching the stoichiometry (entry 7). Catalyst $\mathbf{K}$ also delivered the desired product in $25 \%$ yield (Figure 1). A complex mixture was observed with $\mathbf{L}$ or AuCl (entries 8, 9 and 10).

Thus, we observed that, when increasing the steric bulkiness of the ligand in the gold complex, we obtained the maximum selectivity towards the intermolecular [2+2+2] cycloaddition. We centered our attention in catalyst $\mathbf{E}$ and attempted the reaction with 5 equiv. of ethynylbenzene for 15 h modifying both the temperature and the concentration (Table 2). The oxabicycle product $\mathbf{2 3}$ was obtained in $68 \%$ isolated yield in 0.5 M of DCE at $50^{\circ} \mathrm{C}$ (entry 3 ). Longer reaction times did not affect the results.

Table 2. Effect of the temperature and the concentration."

| Entry | Temperature $\left({ }^{\circ} \mathbf{C}\right)$ | Concentration (M) | Yield $^{\boldsymbol{b}}$ |
| :---: | :---: | :---: | :---: |
| 1 | 25 | 0.1 | $34 \%$ |
| 2 | 25 | 0.5 | $41 \%$ |
| 3 | 50 | 0.5 | $68 \%^{c}$ |
| 4 | 80 | 0.5 | $43 \%$ |
| 5 | 50 | 1.0 | $53 \%$ |

${ }^{a}$ Reaction of 5-methylhex-5-en-2-one with 5 equiv. of ethynylbenzene and $5 \mathrm{~mol} \%$ of $\mathbf{E}$ in DCE for $15 \mathrm{~h} .{ }^{b}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to oxabicycle 23. ${ }^{\text {c }}$ Isolated yield.

New complexes ( $\mathbf{G}$ and $\mathbf{H}$ ) were also tested (Figure 2). ${ }^{17}$ We reasoned that either the methoxy or the methyl groups could further increase the bulkiness around the metal as well as the rigidity of the catalyst. However, $63 \%$ and $57 \%$ yields, respectively, were observed under the optimized conditions.

Figure 2. New gold complexes.
Interestingly, when the reaction was performed at $50^{\circ} \mathrm{C}$ or higher, an unprecedented trimerization of the alkyne was observed forming the 1,3,5-substituted benzene 24 (Figure 3).

Figure 3. Formation of 1,3,5-substituted benzene 24.

## Scope of the $[2+2+2]$ Cycloaddition

The cycloaddition reaction proceeds in a general manner with aryl acetylenes 20 substituted at ortho, meta, or para positions with 6-methylhex-5-en-2-one to form cycloadducts $\mathbf{2 5}$ in moderate to excellent yields under the optimized conditions (Table 3). Aryl acetylenes $\mathbf{2 0}$ with electron-donating and electron-withdrawing substituents, alkyl groups, ethers and halides, react similarly.

[^23]Table 3. Alkyne scope of the [2+2+2] cycloaddition.

${ }^{a}$ Isolated yields. ${ }^{b}$ Reaction conversion in brackets, $100 \%$ if not stated.
2-Naphthylethynylbenzene, a polyaromatic acetylene, afforded oxabicycle 26 smoothly (entry 2). Moreover, a free phenol was also accommodated forming oxabicycle 33 (entry 9), the structure of which was confirmed by X-ray diffraction (Figure 4). Importantly, the reaction could be carried out on a 2 mmol scale without observing a decrease of the yield (74\%). (3Thienyl)acetylene reacted to furnish product 36 but never reached complete conversion (entry 12).

Figure 4. X-Ray crystal structure of oxabicycle 33.
Interestingly, we could also detect the formation of a tetrahydrofuran byproduct in low to moderate isolated yields for some of the substrates attempted (Figure 5).

Figure 5. Tetrahydrofurans formed as by-products.
However, the transformation did not tolerate amines or nitro substituents (entries 1 and 2, Table 4). Similar reactivities were also observed with alkyl acetylenes (entries 3, 4 and 5).

4-Acetylphenyl acetylene formed the corresponding oxabicycle 42 and 3,5bis(trifluoromethyl) ethynylbenzene oxabicycle 43 in $17 \%$ and $6 \%$ yield, respectively (entries 6 and 7).

${ }^{b}$ Isolated yield. ${ }^{c}$ Concentration $=1 \mathrm{M} .{ }^{d}$ Complex $\mathbf{B}$ used as catalyst. ${ }^{e}$ Complex $\mathbf{C}$ used as catalyst.
We reasoned that such an electon-rich alkyne could form a very stable gold complex that would not undergo nucleophilic attack from the oxoalkene. Thus, we decided to tune the reaction conditions for these specific substrates. First, we observed no improvement when modifying the temperature or increasing the concentration (entries 3 and 4). However, $43 \%$ isolated yield of 44 was obtained when switching the stoichiometry of the reaction (entry 5). Further variations of the ligand of the gold complex did not improve the result (entries

6 to 10). The same trend was observed for $p$-methylethynylbenzene and the oxabicycle 45 was isolated in $52 \%$ yield (entry11).

Later, we attempted the cycloaddition using 5-phenylhex-5-en-2-one and alkynes $\mathbf{2 0}$. The corresponding oxabicycles 46 were built with similar yields (Table 6). In some cases, we observed an increase of the yield up to $20 \%$ due to the absence of the tetrahydrofuran byproduct (entry 4).

Table 6. Scope with 5-phenylhex-5-en-2-one.

| Isolated yields. |  |  |  |

Then, we decided to further explore the effect of the substitution pattern in the alkene as well as in the $\alpha$-position of the carbonyl group and the reaction was performed using substrates 53-64 (Figure 6). ${ }^{14 \mathrm{~b}}$ Under the optimized conditions, monosubstituted alkene 53 led to only traces of the oxabicycle 65 (entry 1, Table 7).

Table 7. Oxoalkene scope in the $[2+2+2]$ cycloaddition. ${ }^{a}$

| Entry | Oxoalkene | Product | Yield $^{b}$ |
| :---: | :---: | :---: | :---: |

${ }^{a}$ Reaction with 3.5 equiv. of ethynylbenzene and $5 \mathrm{~mol} \%$ of $\mathbf{E}$ at $50^{\circ} \mathrm{C}$ in DCE for 20 h . ${ }^{b}$ Isolated yields. ${ }^{c}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using $1,4-$ diacetylbenzene as internal standard, yields referred to oxabicycle $\mathbf{6 5}$.

However, when the nucleophilicity of the $\alpha$-substituent was increased (54), the yield improved to $87 \%$ isolated yield for 66 (entry 2 ) whereas decreased to $16 \%$ (67) by using aldehyde 55 (entry 3). Tert-butyl group (56) afforded the oxabicycle $\mathbf{6 8}$ in $54 \%$ isolated yield (entry 4). Substrates 57-64 led to very complex mixtures and no major product was detected.

57

58

63

64

Figure 6. Other oxoalkenes tested.
On the other hand, reaction of ethynylbenzene with 6-methylhept-5-en-2-one led to the formation of cyclobutene 69 as the major product ( $56 \%$ isolated yield), along with oxabicycle 70 (Scheme 10). By changing the substitution pattern of the alkene, the cyclization via an oxonium cation would form preferentially a six-membered ring (71). However, ring expansion of the cyclopropyl intermediate 72 was faster and delivered cyclobutene 69 via 73.

Scheme 10. Effect of the alkene substitution pattern.
Analogously, cycloaddition of ethynlbenzene and ethyl 4-methylpent-4-enoate afforded the cyclobutene scaffold 74 in $47 \%$ isolated yield (Scheme 11). Therefore, when using an ester the nucleophilic attack is also unfavorable.

Scheme 11. Cycloaddition using an ester.

Finally, we designed the construction of a tricyclic structure in one step using this new gold catalyzed transformation. Hence, we synthesized several cyclic oxoalkenes (75-79) to further cyclize them with ethynylbenzene (Figure 7).

75

79

Figure 7. Challenging cyclic oxoalkenes.
Under the optimized conditions with $10 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$, only traces of the corresponding cyclobutenes were detected for $\mathbf{7 5}$ and 76 by ${ }^{1} \mathrm{H}$ NMR spectroscopy (entries 1 and 2, Table 8). A very complex mixture with no major product was observed for 77 (entry 3 ).

Table 8. Formation of a tricyclic scaffold. ${ }^{\text {a }}$

| Entry | Oxoalkene | Modification | Product | Yield ${ }^{\text {b,c }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 78 | - | 80 | 5\% (78\%) |
| 2 | 76 | - | 81 | 5\% |
| 3 | 77 | - | - | Complex mixture |
| 4 | 78 | - | 82 | $12 \%{ }^{\text {d }}$ (89\%) |
| 5 | 78 | 5 equiv. | 82 | $31 \%{ }^{\text {d }}$ |
| 6 | 78 | $m-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | 83 | 19\% (87\%) |
| 7 | 79 | $m-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | 84 | 17\% (94\%) |
| 8 | 79 | 5 equiv. $m-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | 84 | $19 \%{ }^{\text {d }}$ (94\%) |

${ }^{a}$ Reaction with 3.5 equiv. of ethynylbenzene and $10 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ at $50^{\circ} \mathrm{C}$ in DCE for $20 \mathrm{~h} .{ }^{b} \mathrm{Crude}$ analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standar, yields referred to tricyclic oxabicycles. ${ }^{\text {c }}$ Reaction conversion in brackets, $100 \%$ if not stated. ${ }^{\text {a }}$ Isolated yields.

On the other hand, tricyclic structure $\mathbf{8 2}$ could be obtained in $31 \%$ isolated yield via a gold catalyzed $[2+2+2]$ cycloaddition of 5 equiv. of ethynylbenzene with oxoalkene 78 (entry 5). Use of $m$-methoxyenthynylbenzene to oxabicycle $\mathbf{8 3}$ or oxoalkene $\mathbf{7 9}$ did not improve the result (entries 6, 7 and 8 ). We reasoned that the most stable cyclopropyl intermediate might have a configuration that disfavors the nucleophilic attack of the carbonyl group. The configuration of the final product was confirmed by NOESY experiments (Scheme 12).

Scheme 12. Gold-catalyzed formation of a tricyclic scaffold.

## Mechanistic Proposal for the $[2+2+2]$ Cycloaddition

Initially a plausible mechanism for the $[2+2+2]$ cycloaddition was based on the alkyne binding preferentially to the gold catalyst $\mathbf{E}$ forming complex 85. This would further undergo nucleophilic attack from the alkene building the cyclopropyl gold carbene intermediate 86 (Scheme 13). ${ }^{11,18} \mathrm{An}$ intramolecular nucleophilic attack from the carbonyl occured forming oxonium cation 87, which could undergo a Prins-type cyclization. ${ }^{12}$ The carbocation 88 could proceed to 89 via demetalation and complex 85 would be recovered after ligand exchange with ethynylbenzene releasing 23.

Scheme 13. Mechanistic proposal ( $L={ }^{t}$ BuXPhos).
Furthermore, we reasoned that the formation of tetrahydrofurans 37 could be explained due to the ability of gold complexes to deprotonate terminal alkynes (Scheme 14). ${ }^{19}$ Simultaneously, the presence of an acid in the reaction conditions could promote the cationic cyclization of the oxoalkene.

Scheme 14. Formation of tetrahydrofuran 37 ( $L=^{t}$ BuXPhos).
Thus, complex 85 evolved to $\mathbf{9 0}$ generating acid, which reacted with 5-methylhex-5-en-2one to form oxonium cation 91/91'. This could be easily trapped with complex 90 forming the tetrahydrofuran product $\mathbf{3 7}$ along with the regeneration of $\mathbf{8 5}$. ${ }^{9,10}$

[^24]
## Derivatization of the Oxabicycles

Eventually, we also attempted the derivatization of the oxabicycle scaffold $\mathbf{3 3}$ by distinct organic transformations. To start, neither the epoxidation ${ }^{13 b}$, oxidation ${ }^{20}$ nor the bromination of the double bond ${ }^{21}$ led to the desired products and very complex mixtures were observed. Then, attempts of a Diels-Alder cycloaddition of with maleic anhydride led to no reaction. ${ }^{22}$ Moreover, opening of the oxygen bridge also failed in all cases. ${ }^{23}$

Finally, we attempted the hydrogenation of the double bond of $\mathbf{3 3}$ using 1 atm of $\mathrm{H}_{2}$ with $\mathrm{Ni} /$ Raney in ethanol at $80{ }^{\circ} \mathrm{C}$ (Scheme 15). ${ }^{13 \mathrm{~b}}$ However, complete reduction of the oxabicycle product $\mathbf{3 3}$ was observed and $\mathbf{9 2}$ was isolated in $59 \%$ yield. The same product was obtained quantitavely when applying 60 atm of $\mathrm{H}_{2}$ with $\mathrm{Pd} / \mathrm{C}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$.

## Scheme 15. Complete hydrogenation of the oxabicycle product 33.

Nevertheless, when the reaction was performed with 1 atm of $\mathrm{H}_{2}$ with $\mathrm{Pd} / \mathrm{C}$ in methanol at $25^{\circ} \mathrm{C}$, the selective hydrogenation of the alkene in 33 occurred in $95 \%$ isolated yield (diastereomeric ratio 2:1) forming scaffold 93 (Scheme 16). ${ }^{14 b}$

Scheme 16. Selective hydrogenation of the oxabicycle product 33.

[^25]
## Enantioselective [2+2+2] Cycloaddition

Initially, we screened several chiral ligands using $\left[\mathrm{Au}(\mathrm{tmbn})_{2}\right] \mathrm{SbF}_{6}(\mathbf{M})$ as a cationic precatalyst for the optimized $[2+2+2]$ cycloaddition of 3-ethynylphenol with 5-methylhex-5-en-2-one. ${ }^{24} \mathrm{We}$ attempted the reaction with ligands $\mathbf{9 4 - 1 0 2}$ (Figure 8)

96

97

Figure 8. Gold pre-catalyst M and chiral ligands screened.
However, attempts to apply this strategy at $50^{\circ} \mathrm{C}$ failed due to the sensitivity of the gold complex and no reaction was obtained. Therefore, we synthesized the corresponding gold complexes with ligands $\mathbf{9 4}, \mathbf{9 8}$ and $\mathbf{1 0 1}$ and (THT)AuCl. ${ }^{25}$ We used these complexes under the optimized conditions along with $\mathrm{AgSbF}_{6}$ (Table 9). The reaction proceeded in moderate yields when ligands 94 and 98 were used, $58 \%$ and $64 \%$ respectively. Only $18 \%$

[^26]of isolated oxabicycle 33 was obtained with 101. However, chiral HPLC analysis showed no enantioselectivity in the formation of $\mathbf{3 3}$ neither with $\mathbf{9 4}$ nor $\mathbf{9 8} .^{26,27}$

Table 9. Screening of chiral gold complexes for the [2+2+2] cycloaddition.

| Entry | Ligand | Yield $^{\boldsymbol{a}}$ | $\boldsymbol{e} \boldsymbol{e}^{\boldsymbol{b}}$ |

[^27]
## 4. Synthesis of Tetrahydrofurans

## Optimization Towards a New Reaction Pathway

We decided to screen several solvents in order to check if the selectivity towards the formation of the tetrahydrofurans could be improved by modifying the polarity of the environment. ${ }^{28}$ We performed the reaction under the optimized conditions using $p$ bromoethynylbenzene (Table 10). Chlorinated solvents as $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{DCE}$ or $\mathrm{CHCl}_{3}$, showed an excellent reactivity but very low selectivity (entries 1, 2 and 3). Hydrocarbons followed the same trend with even lower yields (entries 4 to 7 ).

Table 10. Screening of solvents for the formation of tetrahydrofurans.

| Entry | Solvent | Yield of 29 $^{\boldsymbol{a}}$ | Yield of 39 $^{\boldsymbol{a}}$ | Conversion $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | DCM | $43 \%$ | $34 \%$ | $98 \%$ |
| 2 | DCE | $41 \%$ | $35 \%$ | $99 \%$ |
| 3 | CHCl | 3 | $29 \%$ | $21 \%$ |
| 4 | Heptane | $2 \%$ | $15 \%$ | $89 \%$ |
| 5 | Cyclohexane | $17 \%$ | $15 \%$ | $97 \%$ |
| 6 | Benzene | $35 \%$ | $37 \%$ | $99 \%$ |
| 7 | Toluene | $33 \%$ | $34 \%$ | $96 \%$ |
| 8 | DMF | $0 \%$ | $0 \%$ | $98 \%$ |
| 9 | MeOH | $0 \%$ | $0 \%$ | $99 \%$ |
| 10 | MeCN | $2 \%$ | $3 \%$ | $100 \%$ |
| 11 | Dioxane | $2 \%$ | $55 \%$ | $66 \%$ |
| 12 | THF | $0 \%$ | $54 \%$ | $99 \%$ |
| 13 | Acetone | $8 \%$ | $16 \%$ | $100 \%$ |
| 14 | EtOAc | $10 \%$ | $42 \%$ | $75 \%$ |
| 15 | Et 20 | $10 \%$ | $39 \%$ | $95 \%$ |
| 16 | - | $36 \%$ | $18 \%$ | $95 \%$ |
| ${ }^{a}$ Crude | $100 \%$ | $100 \%$ |  |  |

On the other hand, very polar solvents such as methanol, DMF or acetonitrile led to very complex mixtures with no major product observed (entries 8, 9 and 10). Then, the use of weak coordinative solvents, for example dioxane or THF, allowed an excellent selectivity, although the yields were still moderate (entries 11 to 15).

[^28]Therefore, we decided to perform the reaction with distinct modifications to the optimized conditions (Table 11).

Table 11. Further modifications for the formation of tetrahydrofurans. ${ }^{a}$

| Entry | Modification | Yield of 29 ${ }^{\text {b }}$ | Yield of 39 ${ }^{\text {b }}$ | Conversion ${ }^{\text {b }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Catalyst C | 18\% | 0\% | 100\% |
| 2 | Catalyst $\mathbf{N}$ | 0\% | 26\% | 95\% |
| 3 | Catalyst $\mathbf{O}$ | 11\% | 0\% | 65\% |
| 4 | $10 \mathrm{~mol} \% \mathbf{E}$ | 57\% | 43\% | 100\% |
| 5 | $3 \AA$ MS | 40\% | 18\% | 92\% |
| 6 | $4 \AA$ MS | 0\% | 0\% | 88\% |
| 7 | $5 \AA$ MS | 8\% | 0\% | 90\% |
| 8 | $10 \mathrm{~mol} \% \mathrm{TsOH}$ | 13\% | $51 \%^{\text {c }}$ | 91\% |
| 9 | $10 \mathrm{~mol} \% \mathrm{NaHCO}_{3}$ | 22\% | 14\% | 80\% |
| 10 | $10 \mathrm{~mol} \% \mathrm{AcOH}$ | 45\% | 35\% | 100\% |
| 11 | $10 \mathrm{~mol} \%$ | 0\% | 0\% | 94\% |
|  | $\mathrm{AcOH} / \mathrm{AcONa}$ (1:1) |  |  |  |
| 12 | $10 \mathrm{~mol} \% \mathrm{CsCO}_{3}$ | 0\% | 0\% | 0\% |

First, we performed the reaction with catalysts $\mathbf{C}, \mathbf{N}$ or $\mathbf{O}$ (Figure 9). Those attempts led to low yields with disparate selectivities (entries 1, 2 and 3 ).

Figure 9. Gold complexes $N$ and $O$.
Treatment with $10 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ led to a higher yields but with a similar selectivity (entry 4). Then, the transformation was performed in the presence of molecular sieves: $3 \AA$ MS did not improve the results and $4 \AA$ MS or $5 \AA$ MS quenched the reactivity towards both cycloadditions (entries 5, 6 and 7). Finally, we screened several additives to promote the deprotonation of the terminal alkyne and the cyclization of the oxoalkene. The best outcome was obtained with catalytic amounts of $p$-toluensulfonic acid, which led to the tetrahydrofuran product 39 in $51 \%$ yield (entry 8). Addition of $\mathrm{NaHCO}_{3}$ or acetic acid did not improve the selectivity (entries 9 and 10). A buffer solution of acetic acid and sodium acetate led to a complex mixture with no major product (entry 11). $\mathrm{CsCO}_{3}$ led to no reaction, probably due to the inactivation of the catalyst (entry 12 ).

Therefore, when the reaction was performed under the optimized conditions adding 10 $\mathrm{mol} \%$ of $p$-toluenesulfonic acid the yield towards the tetrahydrofuran product 39 was improved by $33 \%$ (Scheme 17).

Scheme 17. Optimized conditions for the formation of tetrahydrofurans.

## Expansion of the Scope

Successfully, when this modification was applied to the formation of tetrahydrofurans shown in Figure 5, the same trend was observed (Table 12).

Table 12. Scope of the tetrahydrofuran formation. ${ }^{\text {a }}$

| Entry | $\mathbf{2 0}$ | Product | Yield $^{\boldsymbol{b}}$ |
| :---: | :---: | :---: | :---: |
| 1 | PhCCH | $\mathbf{3 7}$ | $50 \%$ |
| 2 | $p-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | $\mathbf{3 8}$ | $48 \%$ |
| 3 | $m-\mathrm{FC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | $\mathbf{4 0}$ | $47 \%$ |
| 4 | $m-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ | $\mathbf{4 1}$ | $57 \%$ |
| Reaction with 5-methylhex-5-en-2-one, $5 \mathrm{~mol} \%$ of catalyst $\mathbf{E}$ and $10 \mathrm{~mol} \%$ of TsOH at $50{ }^{\circ} \mathrm{C}$ in DCE. |  |  |  |
| ${ }^{b}$ Isolated yields. |  |  |  |

Thus, ethynylbenzene improved by $36 \%$ yield from $14 \%$ of $\mathbf{3 7}$ (entry 1 ), $p-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ in $20 \%$ from $28 \%$ of 38 (entry 2 ), $m-\mathrm{FC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ in $16 \%$ from $31 \%$ of 40 (entry 3 ) and $m$ $\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CCH}$ in $15 \%$ from $42 \%$ of 41 (entry 4 ).

## 5. Gold-Catalyzed Trimerization of Terminal Alkynes

As we mentioned before, the formation of 1,3,5-substituted benzene products such as 24 was constantly observed during the construction of oxabicyclic structures $\mathbf{2 2}$.

Although there are several reports of trimerization of alkynes promoted by gold in heterogenous catalysis, ${ }^{29}$ very few examples using homogeneous complexes have been described. Thus, decomposition of tris(alkyne)gold complex $\mathbf{1 0 3}$ led to the corresponding arene 104 after heating under refluxing conditions in hexane: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 18). Tris(hexamethylene)benzene (104) was isolated from a mixture of compounds in $48 \%$ yield.

Scheme 18. Gold-catalyzed trimerization of cyclooctyne.
On the other hand, the homodimerization of terminal alkynes as dodec-1-yne was reported with ${ }^{~}{ }^{\circ} \mathrm{BuXPhosAuNTf}{ }_{2}$ in the presence of sodium acetate in toluene under reflux for 24 h (Scheme 19). ${ }^{30}$

## Scheme 19. Gold-catalyzed dimerization of alkynes.

Although harsh conditions were employed, good yields and selectivities were obtained. For example, $1,1^{\prime}$-disubstituted alkene $\mathbf{1 0 5}$ and cis-1,2-106 were obtained as a mixture in $72 \%$ isolated yield and 14:1 regioselectivity. However, the scope was rather limited: in the case of ethynylbenzene, the product was obtained only in $8 \%$ yield.

Interestingly, the gold-catalyzed trimerization of alkynes was not a competitive pathway in the $[2+2]$ cycloaddition of alkynes and alkenes leading to cyclobutenes, which was performed at $25^{\circ} \mathrm{C}$ (Scheme 1). ${ }^{4}$

[^29]
## Scope of the Trimerization

Therefore, we continued optimizing the trimerization of alkynes to structures like $\mathbf{1 0 7}$ by screening the concentration as well as the catalyst loading (Table 13). $\left[{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{SbF}_{6}(\mathbf{E})$ was used in DCE at $50^{\circ} \mathrm{C}$. The reaction of ethynylbenzene with $1 \mathrm{~mol} \%$ of the gold catalyst afforded the terphenyl product 24 in $27 \%$ isolated yield (entry 1). The starting alkyne was completely consumed leading as well to distinct oligomerization products. Under the same conditions, the trimerization of $p$-bromo- and $p$ -methoxy- substituted aryl akynes proceeded in $18 \%$ and $11 \%$ yields, respectively (entries 2 and 3).

Table 13. Expansion of the trimerization of terminal alkynes.

| Entry | R- | Y mol\% | Concentration (M) | Product | Yield $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $\mathrm{H}-$ | 1 | 2.0 | $\mathbf{2 4}$ | $27 \%$ |
| 2 | $p-\mathrm{Br}$ | 1 | 2.0 | $\mathbf{1 0 8}$ | $18 \%^{b}$ |
| 3 | $p-\mathrm{MeO}$ | 1 | 2.0 | $\mathbf{1 0 9}$ | $11 \%^{b}$ |
| 4 | $\mathrm{H}-$ | 3 | 2.0 | $\mathbf{2 4}$ | $40 \%$ |
| 5 | $m-\mathrm{MeO}$ | 3 | 2.0 | $\mathbf{1 1 0}$ | $2{ }^{b}{ }^{b}$ |
| 6 | $m-\mathrm{Cl}$ | 3 | 2.0 | $\mathbf{1 1 1}$ | $6 \%^{b}$ |
| 7 | $p-\mathrm{Me}$ | 3 | 2.0 | $\mathbf{1 1 2}$ | $33 \%$ |
| 8 | $p-\mathrm{F}$ | 3 | 2.0 | $\mathbf{1 1 3}$ | $37 \%$ |
| 9 | $m-\mathrm{Me}$ | 3 | 2.0 | $\mathbf{1 1 4}$ | $20 \%$ |
| 10 | $\mathrm{H}-$ | 3 | 0.5 | $\mathbf{2 4}$ | $43 \%$ |

${ }^{a}$ Isolated yields. ${ }^{b}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to trimers 107.

The reaction with ethynylbenzene could be improved to $40 \%$ yield of 24 with $3 \mathrm{~mol} \%$ of catalyst (entry 4). Only traces of products $\mathbf{1 1 0}$ and $\mathbf{1 1 1}$ were observed with $m$-methoxy or $m$-chloro substitution (entries 5 and 6 ). Moderate yields were obtained for $p$-methyl, $p$ fluoro and $m$-methyl substitution (entries 7, 8 and 9). Thus, terphenyl 112 was obtained in $33 \%$ isolated yield, $\mathbf{1 1 3}$ in $37 \%$ and $\mathbf{1 1 4}$ only in $20 \%$. Decrease of the concentration did not avoid the oligomerization and showed minimum improvement in the formation of 24 (entry 10 ).

## 6. Conclusions

Gold-catalyzed intramolecular cycloisomerizations have been the benchmark of the expansion of this type of chemistry whereas intermolecular transformations proved to the more challenging and related reports were rather limited. Therefore, we have developed a new intermolecular gold-catalyzed transformation based on a cascade [2+2+2] cycloaddition of an alkyne, an alkene and a carbonyl group. ${ }^{31}$ As an example, we optimized the reaction between $m$-methoxyethynylbenzene and 5-methylhex-5-en-2-one to furnish oxabicycle 34 in $91 \%$ isolated yield (Scheme 20), which proceeded with $5 \mathrm{~mol} \%$ of $\left[{ }^{t}\right.$ BuXPhosAuNCMe] $\mathrm{SbF}_{6}(\mathbf{E})$ in DCE at $50^{\circ} \mathrm{C}$.

Scheme 20. Gold-catalyzed [2+2+2] cycloaddition to furnish 34.
The methodology showed a broad scope in the aryl substitution leading to the cycloadducts in moderate to excellent yields. Derivatization of the oxabicycle products showed the robustness of these scaffolds.

We also screened the effect of the alkene substitution pattern and the $\alpha$-position of the carbonyl moiety. Interestingly, when the oxonium cation was not entropically favoured or the nucleophilicity of the carbonyl decreased, a cyclobutene scaffold was obtained instead. Thus, products 69 ( $54 \%$ ) and 74 ( $47 \%$ ) were formed from 6-methylhept-5-en-2-one and ethyl 4-methylpent-4-enoate, respectively (Figure 10).

Figure 10. Cyclobutenes 69 and 74 formed as exceptions to the [2+2+2].
For similar reasons, cycloaddition with a cyclic oxoalkene such as $\mathbf{7 8}$ led to the tricyclic structure $\mathbf{8 2}$ only in $31 \%$ isolated yield (Scheme 12)

[^30]

Scheme 12. Gold-catalyzed formation of a tricyclic scaffold.
Moreover, we could tune the reaction pathway towards the formation of a tetrahydrofuran scaffold by adding $10 \mathrm{~mol} \%$ of $p$-toluenesulfonic acid. Thus, structure 39 was obtained in $51 \%$ isolated yield (Scheme 17).

## Scheme 17. Optimized conditions for the formation of tetrahydrofurans.

Analogously, trimerization of terminal alkynes was refined to give $43 \%$ yield of terphenyl 24 in the case of ethynylbenzene (Scheme 21).

Scheme 21. Optimized trimerization of terminal alkynes.
Overall, we could selectively and effectively control the reaction pathways towards an oxabicycle, a cyclobutene, a tetrahydrofuran or a terphenyl starting from exactly the same commercially available building blocks by digging into a mechanistic reasoning and finely tuning the reaction conditions.

UNIVERSITAT ROVIRA I VIRGILI

## Chapter 3:

Mechanistic Study of a [2+2+2] Cycloaddition: Role of Digold Complexes

## 1. Introduction

As explained in the General Introduction, numerous transformations catalyzed by gold have been developed during the last decade nourishing the field of organic synthesis. ${ }^{1}$ In most cases, these reactions proceed by multistep pathways that are rather complex. Therefore, a mechanistic understanding has been based often on analogy and speculation. Although coherent mechanistic schemes have been proposed by means of DFT calculations, as well as isotopic labelling and kinetic experiments, isolation of key intermediates has proven to be challenging. ${ }^{2}$

In Chapter 2, we presented the intramolecular cascade [2+2+2] reaction between an alkyne, an alkene and a carbonyl group. 1,6-Enyne bearing a ketone moiety 1 was synthesized and cyclized using AuCl (Scheme 1). ${ }^{3}$ This reaction afforded the tricyclic scaffold 2 via two $\mathrm{C}-\mathrm{C}$ and one $\mathrm{C}-\mathrm{O}$ bond in $84 \%$ isolated yield (diastereoselectivity $50: 1$ ), together with diene 3 as a minor by-product.

Scheme 1. Gold-catalyzed [2+2+2] cyclization of 1,6-enyne 1 .
The gold catalyst presumably activated preferentially the alkyne of 1,6-enyne $\mathbf{1}$, which could suffer a nucleophilic attack from the alkene forming cyclopropyl gold carbene 4 . The intermediate could be trapped via intramolecular nucleophilic attack of the ketone followed by a Prins-type cyclization. The stereochemistry of the final product 2 suggested that the intramolecular attack of the ketone proceeded through the lower face of the cyclopropyl ring (4). However, no further evidence to support this hypothesis was provided.

In general, alkynes are selectively activated by gold(I) in the presence of alkenes. This high site-selectivity of gold(I) is not directly related to a thermodynamic preference for the coordination to the alkynes, but to a higher reactivity of the $\left(\eta^{2}\right.$-alkyne) gold(I) complexes towards nucleophilic attack. ${ }^{4}$ Thus, NMR studies, supported by DFT calculations,

[^31]confirmed that both 5 and $\mathbf{6}$ bearing [JohnPhosAu] ${ }^{+}$coexisted with free 1,7-enyne $\mathbf{7}$ and catalyst B (Scheme 2). However, this class of substrates exclusively reacted by intramolecular attack of the alkene to ( $\eta^{2}$-alkyne)gold(I) species such as 5.

Scheme 2. Competitive coordination of gold to alkynes and alkenes.
Nucleophilic attack of ( $\eta^{2}$-alkyne)gold complexes to give trans-alkenyl species via an outer-sphere mechanism is widely accepted. ${ }^{5}$ The first stable organogold intermediate (8) was isolated in an intramolecular reaction between an allene and an ester in compound 9 (Scheme 3). ${ }^{6}$ This result demonstrated the formation of a vinyl gold complex by nucleophilic attack onto an allene-gold complex.

Scheme 3. Isolation of the first vinyl gold complex (8).
However, more complex carbenoid intermediates were suggested based on DFT calculations, for example, in the 1,2- or 1,3-acyloxy migrations of propargylic carboxylates or in the cycloisomerizations of $1, n$-enynes. ${ }^{1,3,7}$ Consequently, an interesting debate was

[^32]centred on the nature of the gold-carbon bond in complexes of type [LAuCHR]. ${ }^{8}$ The intermolecular cycloaddition between alkynes and alkenes led to cyclobutenes such as $\mathbf{1 0}$ using bulky phosphines as ligands, for example [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{SbF}_{6}$ (E). Gold(I) carbene $\mathbf{1 1}$ or gold(I) stabilized carbocation 11' could be conceived as intermediates, which explained the regioselectivity of the transformation (Scheme 4). ${ }^{9}$ Although seldom reports with spectroscopic or structural data are presented in the literature, highly distorted cyclopropyl gold carbenes 11/11' were also proposed in the reaction of propiolic acid with alkenes as well as in the cascade cyclizations of $1, n$-enynes. ${ }^{10}$

Scheme 4. [2+2] Cycloaddition of alkynes with alkenes.
On the other hand, the regioselective cyclization of enynes $\mathbf{1 2}$ with a pendant carboxylic acid formed selectively lactones $\mathbf{1 3}$ and/or $\mathbf{1 4}$ (Scheme 5). ${ }^{11}$

Scheme 5. Cascade cyclization of 1,6-enyne 12.

[^33]Following the Stork-Eschenmoser model for cyclizations of squalene and oxidosqualene, ${ }^{12}$ these types of cascade cyclizations were rationalized as proceeding through concerted transition states such as $\mathbf{1 5}$, not involving cyclopropyl gold(I) carbenes as discrete intermediates. ${ }^{13}$

However, other studies strongly suggested that gold-catalyzed 1,n-enyne cyclizations occurred in a step-wise fashion. ${ }^{1,3,7,10}$ As an example, reaction of 1,6-enyne $\mathbf{1 6}$ with indole afforded adducts $\mathbf{1 7}$ and $\mathbf{1 8}$ by nucleophilic attack at the carbene (a) of intermediate $\mathbf{1 9}$ or the cyclopropyl ring (b) with retention of the configuration (Scheme 6). ${ }^{14}$ The use of complex $\left[\mathrm{IPrAu}(\mathrm{NCPh}) \mathrm{SbF}_{6}(\mathbf{C})\right.$ as catalyst, with a highly donating NHC ligand, enhanced the carbene-like nature of this intermediate, favouring nucleophilic attack at the carbene carbon leading to $\mathbf{1 8}$.

Scheme 6. Nucleophilic addition to the gold carbene position.
Furthermore, the carbene-like character of the intermediates generated by reaction of $1, n$ enynes with gold was more clearly revealed by their trapping with alkenes. ${ }^{7 \mathrm{~g}}$ Thus, for example, reaction of dienyne 20 with $\left[\mathrm{Ph}_{3} \mathrm{PAuNCMe}^{2}\right] \mathrm{SbF}_{6}$ led stereoselectively to tetracyclic compound 21 (Scheme 7).

Scheme 7. Intramolecular cyclopropanation of 1,6-enyne 20.

[^34]DFT calculations were consistent with a concerted, asynchronous cyclopropanation through intermediate 22. A similar model was proposed for the intermolecular cyclopropanation of 1,6 -enynes by alkenes. ${ }^{15}$ The cyclopropanation was found to be concerted for symmetrical or less polarized alkenes whereas styrenes reacted in a stepwise manner. Nevertheless, the overall process was stereospecific since formation of the second carbon-carbon occurred through a very small energy barrier.

Oxygen transfer from diphenylsulfoxide to the carbene-like carbon of intermediate 23, formed during the reaction of 1,6-enyne 24 with gold, led to the corresponding aldehyde 25 (Scheme 8). ${ }^{16}$

Scheme 8. Oxidation of the gold carbene intermediate.
Then, opening of cyclopropenone acetal $\mathbf{2 6}$ with $\mathrm{Ph}_{3} \mathrm{PAuNTf}_{2}$ led to $\boldsymbol{Z} \mathbf{- 2 7}$ that isomerised to $\boldsymbol{E} \mathbf{- 2 7}$ presumably through gold carbene $\mathbf{2 8}$ (Scheme 9). ${ }^{17}$ The spectroscopic data of $\boldsymbol{Z} \mathbf{- 2 7}$ and $\boldsymbol{E}-\mathbf{2 7}$ revealed an oxocarbenium cationic structure.

Scheme 9. Bond rotation analysis of organogold species (relative energies in kcal/mol).
An in-depth theoretical analysis of the bond rotation energy for different carbocations demonstrated that LAu- has a similar stabilizing effect as MeO - on an allyl carbocation (M06, 6-31G** (C, H, O, P, N, S, F) and LACVP** ( Au ) in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{8}$ Moreover, the bond length between gold and the carbene carbon decreased with strong $\sigma$-donating ligands such as chloride or N-heterocyclic carbenes but it increased with less donating, $\pi$-acidic ligands such as phosphines or phosphites by reducing the back-donation to the substrate. This study concluded a continuum character of the organogold species ranging from metal stabilized singlet carbene to metal coordinated carbocation depending on the substitution pattern and the ligand on gold.

[^35]Finally, digold species were proposed to be involved as key intermediates in the cyclization of 1,5 -allenynes such as 29 towards 30 using [ $\left.\left(\mathrm{Ph}_{3} \mathrm{PAu}\right)_{3} \mathrm{O}\right] \mathrm{BF}_{4} .{ }^{18,19}$ The transformation proceeded by a stereospecific intramolecular hydrogen atom transfer from the allene to the alkyne based on deuterium labeling experiments (Scheme 10). According to DFT calculations, gold coordinated to the alkyne making the proton more acidic and leading to an alkynyl gold complex that reacted with a second equivalent of the catalyst to form 31. Nucleophilic attack of the allene generated the allyl stabilized carbocation 32 in the rate-determining step, which was followed by an intramolecular 1,5-hydrogen shift leading to $\mathbf{3 0}$ through germinal diaurated species $\mathbf{3 3}$.

Scheme 10. Involvement of digold species as key intermediates.
Digold complexes related to $\mathbf{3 1}, \mathbf{3 2}$ or $\mathbf{3 3}$ were later found to play relevant roles in catalysis. As an example, during the intramolecular hydroarylation of allenes, complex 34 was isolated as the catalyst resting state (Figure 1). ${ }^{20}$ A species of type $\mathbf{3 5}$ was also generated by gold-boron transmetallation from a vinyl boronate. ${ }^{21}$ The analysis of structure 35 revealed an important stabilization from the oxygen atom and two almost regular carbon-gold $\sigma$-bonds.

Figure 1. Isolated digold complexes.

[^36]
## 2. Objectives

As reported in Chapter 2, the intermolecular gold-catalyzed [2+2+2] of an alkyne with an alkene bearing a carbonyl moiety was developed (Scheme 11). ${ }^{22}\left[{ }^{t} \mathrm{BuXPhosAuNCMe} \mathrm{SbF}_{6}\right.$ (E) was used in DCE at $50^{\circ} \mathrm{C}$. Thus, ethynlbenzene and 6-methylhept-5-en-2-one afforded oxabicycle 36 in $68 \%$ isolated yield.

## Scheme 11. Gold-catalyzed [2+2+2] cycloaddition of ethynylbenzene and 6-methylhept-5-en-2-one .

The preferential binding of the gold catalyst to the alkyne was suggested based on the precedents in other gold-catalyzed transformations (Scheme 12). Then, complex 37 would undergo nucleophilic attack of the alkene building the cyclopropyl gold carbene intermediate 38 regio- and stereoselectively. An intramolecular nucleophilic attack from the carbonyl could occur and the oxonium cation 39 would be formed, which could further experience a Prins-type cyclization. The carbocation $\mathbf{4 0}$ could proceed via demetalation to 41 and recover complex 37 after ligand exchange with ethynylbenzene releasing 36. Therefore, a step-wise process was initially convieved.

Scheme 12. Mechanistic proposal ( $L^{=}{ }^{t}$ BuXPhos).
Due to the lack of evidence in such transformations, we were challenged to study this cycloaddition more in depth to provide some insights that would allow the design of better catalysts to improve this type of reactions.

[^37]
## 3. Theoretical Approach

First, we decided to check the feasibility of the proposal computationally. DFT calculations of the suggested pathway were performed $(\mathrm{M} 06,6-31 \mathrm{G}(\mathrm{d})(\mathrm{C}, \mathrm{H}, \mathrm{P}, \mathrm{O})$ and $\operatorname{SDD}(\mathrm{Au})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ).

Gold complex $\mathbf{3 7}$ was simplified to $\mathbf{4 2}$ bearing $\mathrm{PMe}_{3}$ as ligand instead of ${ }^{t} \mathrm{BuXPhos}$ for time-consuming concerns. We analysed the competitive binding to the metal between the alkyne, the alkene and the carbonyl moiety by comparing the energies of the different complexes (Figure 2). ${ }^{1,4,9}$

Figure 2. $\mathrm{Me}_{3} \mathrm{PA}^{+}$competitive coordination.
Thus, we could observe that $\mathrm{Me}_{3} \mathrm{PAu}^{+}(\mathbf{4 3})$ is at least $15.0 \mathrm{kcal} / \mathrm{mol}$ less stable than complexes as $\left[\mathrm{Me}_{3} \mathrm{PAuL}\right]^{+}$in which $\mathrm{L}^{\prime}$ could be any substrate. ${ }^{23}$ Coordination to the ketone (45) was $1 \mathrm{kcal} / \mathrm{mol}$ less stable for in the presence of unsaturated $\mathrm{C}-\mathrm{C}$ bonds. Furthermore, we could determine that, when using $\mathrm{PMe}_{3}$ as ligand, the coordination of the alkene was preferred by $0.4 \mathrm{kcal} / \mathrm{mol}(44)$. Nevertheless, when $\mathrm{PMe}_{2}$ (biphenyl) was used as ligand the difference in energy decreased (Figure 3).

[^38]

$0.0 \mathrm{kcal} / \mathrm{mol}$
46

$3.4 \mathrm{kcal} / \mathrm{mol}$

Figure 3. $\mathrm{Me}_{2}($ biphenyl $) \mathrm{PAu}{ }^{+}$competitive coordination.
Hence, the coordination of the alkyne (46) or the alkene (47) differed only by $0.1 \mathrm{kcal} / \mathrm{mol}$. Therefore, the selectivity towards a triple bond observed experimentally when using bulky catalysts was unlikely due to its preferential binding. ${ }^{9}$ In this case, coordination of the ketone (48) was $3.4 \mathrm{kcal} / \mathrm{mol}$ less stable.

Finally, we checked the coordination energies using ${ }^{t} \mathrm{BuXPhosAu}{ }^{+}$(Figure 4). The alkene binding (49) was $0.5 \mathrm{kcal} / \mathrm{mol}$ more favoured comparing to the alkyne (37) and the corresponding ketone complex (50) was $5.0 \mathrm{kcal} / \mathrm{mol}$ less stable.

$0.0 \mathrm{kcal} / \mathrm{mol}$
37

$-0.5 \mathrm{kcal} / \mathrm{mol}$
49

$5.0 \mathrm{kcal} / \mathrm{mol}$

Figure 4. ${ }^{t}$ BuXPhosAu ${ }^{+}$competitive coordination.

We analysed the nucleophilic attack of the alkene towards the activated alkyne $\mathbf{4 2}$. We considered the initial regioselective formation of a cyclopropyl gold carbene in order to check if a step-wise process was possible (Figure 5). ${ }^{1,3,9}$ The activation energy of this step was $15.9 \mathrm{kcal} / \mathrm{mol}$ towards $\mathbf{T S}^{\neq}{ }_{42-51}$, which was both kinetically and thermodynamically feasible. Intermediate $\mathbf{5 1}$ was $1.2 \mathrm{kcal} / \mathrm{mol}$ less stable than its precursors so this step was endothermic.

Moreover, we contemplated that two stereogenic centres would be formed, which could lead to two diastereoisomers: 51 and 52 (Figure 6). In the case of intermediate 52, 16.2 $\mathrm{kcal} / \mathrm{mol}$ were necessary to build $\mathbf{T S}^{\boldsymbol{4} 2-52}$ and it was $2.2 \mathrm{kcal} / \mathrm{mol}$ less stable than $\mathbf{5 1}$.

$\Delta \mathrm{G} \neq 15.9 \mathrm{kcal} / \mathrm{mol}$ $\Delta G=1.2 \mathrm{kcal} / \mathrm{mol}$

51

$\Delta \mathrm{G}^{\neq}=16.2 \mathrm{kcal} / \mathrm{mol}$
$\Delta \mathrm{G}=3.5 \mathrm{kcal} / \mathrm{mol}$

52

Figure 5. Cyclopropylgold carbene 51.
Figure 6. Cyclopropyl gold carbene 52.
Alternatively, we also considered the opposite configuration of the gold carbene. ${ }^{10 \mathrm{c}}$ Thus, cyclopropyl gold carbenes $\mathbf{5 3}$ and $\mathbf{5 4}$ were calculated (Figure 7). Intermediate $\mathbf{5 3}$ was 0.9 $\mathrm{kcal} / \mathrm{mol}$ more stable than $\mathbf{5 1}$ and $\mathbf{5 4} 3.0 \mathrm{kcal} / \mathrm{mol}$ less stable. However, the activation energies were 19.4 and $22.3 \mathrm{kcal} / \mathrm{mol}$, respectively.

$\begin{aligned} \Delta \mathrm{G}^{\neq} & =19.4 \mathrm{kcal} / \mathrm{mol} \\ \Delta \mathrm{G} & =0.3 \mathrm{kcal} / \mathrm{mol}\end{aligned}$

53

$\Delta \mathrm{G}^{\neq}=22.3 \mathrm{kcal} / \mathrm{mol}$
$\Delta \mathrm{G}=4.2 \mathrm{kcal} / \mathrm{mol}$
54

Figure 7. Cyclopropyl gold carbenes 53 and 54.

Although the differences were rather low, we could assume that the transformation started with the stereoselective formation of the cyclopropyl gold carbene 51. Furthermore, these results suggested a step-wise process towards the construction of the oxabicycle, as the C C bond preceded the formation of the $\mathrm{C}-\mathrm{O}$ bond.

Interestingly, we obtained the same type of scaffold for all the cyclopropyl gold carbene intermediates and we could confirm that those are highly unsymmetrical structures. ${ }^{7 f}$ Thereby, the new $\mathrm{C}-\mathrm{C}$ bond lengths were $1.58 \AA$ and $1.73 \AA$ for $\mathbf{5 1}, 1.58 \AA / 1.72 \AA$ for $\mathbf{5 2}$, $1.59 \AA / 1.76 \AA$ for 53 and $1.57 \AA / 1.75 \AA$ for 54 . The largest bond length was in the substituted carbon atom in all the cases.

Subsequently, we studied the intramolecular regioselective nucleophilic attack of the ketone to the more substituted carbon of the cyclopropyl gold carbene 51. ${ }^{14}$ Beside the entropic factors, the bond lengths difference would imply an important positive charge in that position. Nevertheless, the nucleophilic attack could occur from both sides of the cyclopropyl ring. Consequently, we calculated both transition states, named TS(up) ${ }^{\neq 1-55}$ and TS(down) ${ }_{51-55}{ }^{\text {, (Figure 8). }}$

$\Delta \mathrm{G}^{\neq}=3.4 \mathrm{kcal} / \mathrm{mol}$

$\Delta \mathrm{G}^{\neq}=4.1 \mathrm{kcal} / \mathrm{mol}$

TS(down) ${ }^{\neq 51-55}$

Figure 8. Intramolecular attack of the ketone to the cyclopropyl ring through the upper or the lower face.

According to the configuration of the final product (2), attack through the lower face of $\mathbf{4}$ was suggested in the case of the intramolecular gold-catalyzed [2+2+2] cyclization of $\mathbf{1}$ (Scheme 2). However, in the absence of the strains induced by the carbon tether, ${ }^{3}$ the attack through the upper face of $\mathbf{5 1}$ was $3.4 \mathrm{kcal} / \mathrm{mol}, 0.7 \mathrm{kcal} / \mathrm{mol}$ below than though the lower face. Oxonium cation $\mathbf{5 5}$ was $10.1 \mathrm{kcal} / \mathrm{mol}$ more stable than the cyclopropyl gold carbene 51 (Figure 9).

Afterwards, the Prins-type cyclization of 55 required 9.1 $\mathrm{kcal} / \mathrm{mol}$ to afford the carbocation 56, which was 6.4 $\mathrm{kcal} / \mathrm{mol}$ less stable but evolved to $57,40.5 \mathrm{kcal} / \mathrm{mol}$ more stable than 56 (Figure 10). ${ }^{24}$

$\Delta G=-10.1 \mathrm{kcal} / \mathrm{mol}$

Figure 9. Oxonium cation 55.

$\Delta \mathrm{G}^{\neq}=9.1 \mathrm{kcal} / \mathrm{mol}$
$\mathrm{TS}^{\neq 55-56}$

$\Delta \mathrm{G}=6.4 \mathrm{kcal} / \mathrm{mol}$

56

$\Delta \mathrm{G}=-40.5 \mathrm{kcal} / \mathrm{mol}$

Figure 10. Prins cyclization of 55 to 57 through 56.
Accordingly, we suggested the most favoured pathway towards the formation of oxabicycle 36. Using ethynylbenzene and 6-methylhept-5-en-2-one with gold catalysis, the metal would compete for the coordination of the alkyne and the alkene (Figure 2, 3 and 4). Then, complex 42 could undergo a regioselective nucleophilic attack from the alkene forming a cyclopropyl gold carbene $\mathbf{5 1}$ with anti-configuration in the rate-determining step of the process (Scheme 13). Regioselective intramolecular nucleophilic attack of the ketone to the more substituted carbon occurs preferentially at the upper face to form oxonium cation 55. However, attack from the lower face is only $0.7 \mathrm{kcal} / \mathrm{mol}$ less favourable. Prins-type cylclization proceeds with $9.1 \mathrm{kcal} / \mathrm{mol}$ activation energy to form $\mathbf{5 6}$ and then the coordinated product $57,34.1 \mathrm{kcal} / \mathrm{mol}$ more stable than $\mathbf{5 5}$. Ligand exchange with ethynylbenzene would restart the catalytic cycle.

[^39]

## Scheme 13. Calculated mechanism of the [2+2+2] cycloaddition (relative energies in kcal/mol).

Finally, we also considered the formation of a cyclobutene 58 via a [2+2] cycloaddition between the alkyne and the alkene as a competitive pathway (Scheme 14). ${ }^{9}$ However, ring expansion of the cyclopropyl gold carbene $\mathbf{5 1}$ would require $7.4 \mathrm{kcal} / \mathrm{mol}$, compared to 3.4 , and the coordinated product would be $22.6 \mathrm{kcal} / \mathrm{mol}$ more stable than $\mathbf{5 1}$, compared to 44.1. Therefore, these results explained that the cyclobutene $\mathbf{5 8}$ was not usually observed during the $[2+2+2]$ cycloaddition.

Scheme 14. Theoretical formation of cyclobutene 58.

## 4. Isotopic Labelling Experiments

We decided to study the deuterium incorporation in the final products when the goldcatalyzed $[2+2+2]$ cycloaddition was performed between deuterated $p$ bromoethynylbenzene and 6-methylhept-5-en-2-one (Scheme 15). As explained in Chapter 2, the oxabicycle product 59 was formed in $56 \%$ isolated yield together with $17 \%$ of the tetrahydrofuran byproduct $\mathbf{6 0} .{ }^{22}$

Scheme 15. Deuterium incorporation during the $[2+2+2]$ cycloaddition.

The isotopic transfer was totally selective during the formation of the oxabicycle 59. Deuterium incorporation was observed only in the olefin moiety, which supported the theoretical results. However, the isotopic labelling was only $75 \%$ in contrast of $96 \%$ in the $p$ bromoethynylbenzene (Figure 11).

Figure 11. ${ }^{1}$ H NMR spectra of deuterated oxabicycle 59.
On the other hand, the tetrahydrofuran $\mathbf{6 0}$ showed $100 \%$ of deuterium incorporation in the terminal position of the alkene and $55 \%$ for each of the diastereotopic $\mathrm{CH}_{2}$ hydrogens in the fivemembered ring (Figure 12).

Figure 12. ${ }^{1}$ H NMR spectra of deuterated tetrahydrofuran 60.

We reasoned that the formation of tetrahydrofurans such as $\mathbf{6 0}$ could be explained due to the ability of gold complexes to deprotonate terminal alkynes (Scheme 16). ${ }^{19 f, 25}$ Simultaneously, the presence of an acid in the reaction conditions can promote the cationic cyclization of the oxoalkene. Thus, complex $\mathbf{6 1}$ evolved to $\mathbf{6 2}$ generating acid, which reacted with 5 -methylhex-5-en-2-one to form oxonium cation 63/63'. This could be easily trapped with complex 62 forming the tetrahydrofuran product $\mathbf{6 0}$ along with the regeneration of 61 .

Scheme 16. Formation of tetrahydrofuran $60\left(L^{=}{ }^{t}\right.$ BuXPhos).
Nevertheless, this proposal only explained the deuterium incorporation to the terminal position of the alkene. If we assumed that the acid-promoted cyclization of the oxoalkene was a reversible reaction, the incorporation in the five-membered ring could be explained as well (Scheme 17). Hence, the equilibrium towards the more substituted alkene 64 would be more favored than 6 -methylhept-5-en-2-one. The re-cyclization to $\mathbf{6 3} / \mathbf{6 3}$ ' would involve the incorporation of deuterium in the five-membered ring with no diastereoselectivity.

## Scheme 17. Reversible cyclization of the oxoalkene.

Therefore, the formation of the tetrahydrofuran $\mathbf{6 0}$ presented a more complex scenario that was still consistent with the initial proposal.

[^40]
## 5. Formation of Digold Complexes

## Monitoring of the $[2+2+2]$ Cycloaddition

Attempts to detect any of the gold intermediates proposed were performed by monitoring the $[2+2+2]$ cycloaddition between an excess of ethynylbenzene with 6 -methylhept-5-en-2one via ${ }^{1} \mathrm{H}$ NMR spectroscopy. ${ }^{2}$ The reaction was performed in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ at $30{ }^{\circ} \mathrm{C}$ using $5 \mathrm{~mol} \%$ of complex $\mathbf{E}$ (Scheme 18). The residual peak of the solvent was used as the internal standard. ${ }^{10 \mathrm{c}}$

Scheme 18. [2+2+2] Cycloaddition followed by ${ }^{1}$ H NMR spectroscopy.
Under these conditions, the oxabicycle product 36 was formed, along with tetrahydrofuran byproduct 65 , the trimerization product 66 and traces of the corresponding cyclobutene, dienes and alkyne di- or oligomerization. ${ }^{9,22,25 \mathrm{~d}}$ We could quantify the formation of oxabicycle 36 and trimer 66 as well as the consumption of the alkyne and the oxoalkene (Figure 13). However, the quantification of the tetrahydrofuran $\mathbf{6 5}$ was not reliable due to signal overlapping.

Figure 13. Variation of products with time.
In the variation of the amount of the different products with time, we could observe that the consumption of the alkyne was indeed much faster than the oxoalkene. Moreover, the oxabicycle 36 was the major product and no intermediates could be identified. This pattern was clearer when the percentage of formation or consumption were analysed (Figure 14).

Figure 14. Percentages of products with time.
Attempts to determine the order of the reagents led to non-conclusive results due to the competitive pathways. ${ }^{26}$ Furthermore, a single signal at $\delta=65.22 \mathrm{ppm}$ was observed by ${ }^{31} \mathrm{P}$ NMR spectroscopy over the whole process, which did not correspond to ${ }^{t}{ }^{\prime} \mathrm{BuXPhosAuNCMe}^{2} \mathrm{SbF}_{6}(\mathbf{E})$.

## Crystallization of the Resting State

According to the DFT calculations, the nucleophilic attack of the alkene towards gold complex 37 was the rate-determining step due to the highest activation energy (Scheme 14). Therefore, complex 37 could be the resting state of the catalytic cycle. Nevertheless, the theoretical approach did not consider the formation of such species, which could involve a more complicated scenario. Addition of pentane to the reaction mixture allowed to isolate digold complex 67 (Figure 15). ${ }^{18-21}$

Figure 15. X-Ray crystal structure of digold complex 67.
In the solid state, ${ }^{t} \mathrm{BuXPhos} \mathrm{Au}^{+}$was bonded in the $\sigma$-position of the deprotonated ethynylbenzene whereas the second fragment was coordinated in the $\pi$-cloud of the triple bond. The distance $\mathrm{C}-\mathrm{Au}$ for the first one was $2.05 \AA$ and for the second one, $2.22 \AA$ in the terminal position and $2.27 \AA$ to the phenyl substituted one. However, both phosphorous atoms are chemically equivalent in solution after NMR scale, which corresponds to a fluxional dinuclear complex.

[^41]Analogously to the formation of the tetrahydrofuran byproduct (Scheme 16), we reasoned that, after ligand exchange, complex 37 could undergo deprotonation of ethynylbenzene building alkynyl gold complex 68 (Scheme 19). ${ }^{19 f, 25}$ Apparently, reaction of 68 with another equivalent of $\left[{ }^{t} \mathrm{BuXPhosAuNCMe} \mathrm{SbF}_{6}(\mathbf{E})\right.$ could form the more stable digold complex 67.

Scheme 19. Formation of digold complex 67 ( $L==^{t}$ BuXPhos).
We verified the involvement of digold complex $\mathbf{6 8}$ by synthesizing it though an alternative route (Scheme 20). Ethynylbenzene was deprotonated with LiHMDS at $0{ }^{\circ} \mathrm{C}$, which reacted with ${ }^{t} \mathrm{BuXPhosAuCl}$ at $25{ }^{\circ} \mathrm{C}$ for 12 h forming the alkynyl gold complex $\mathbf{6 8}$. The crude mixture was concentrated and added to a solution of one equivalent of ${ }^{t} \mathrm{BuXPhosAuCl}$ followed by $\mathrm{AgSbF}_{6}$. Digold complex 67 was obtained after recrystallization in $99 \%$ isolated yield.

68

Scheme 20. Synthesis of digold complex 67.

## Low Temperature NMR Experiments

Beside the role of digold complex 67, we decided to prove the presence of complex 37 as it was theoretically the active species towards the nucleophilic attack of the alkene. Although gold forms stable monomeric dicoordinate $\pi$-complexes with alkenes, ${ }^{27} 1,3$-dienes, ${ }^{28}$

[^42]allenes ${ }^{29}$ and substituted alkynes, ${ }^{30}$ no examples with terminal alkynes were reported so far (see General Introduction). Therefore, 10 equiv. of ethynylbenzene were added over [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{SbF}_{6}(\mathbf{E})$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.04 \mathrm{M})$ at $-78{ }^{\circ} \mathrm{C}$ and analysed by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy (Scheme 21).

Scheme 21. Detection of gold complex 37.
At $-60{ }^{\circ} \mathrm{C}$, [ ${ }^{t} \mathrm{BuXPhosAuNCMe} \mathrm{SbF}_{6}(\mathbf{E})$ and complex 37 could be detected as well as digold complex 67. The ${ }^{31} \mathrm{P}$ resonance of complex 37 appeared at $\delta=65.43 \mathrm{ppm}$ and it could be identified via the correlation proton-phosphorous performing a ${ }^{1} \mathrm{H}-{ }^{31} \mathrm{P}$ HMBC experiment (Figure 16). Thus, we could observe a cross peak between the phosphorous signal and the acetylene proton of the coordinated ethynylbenzene, which appeared at $\delta=$ 3.39 ppm splitted into a doublet $\left(J\left({ }^{1} \mathrm{H}-{ }^{31} \mathrm{P}\right)=4.4 \mathrm{~Hz}\right)$. No cross peak could be observed
 when a ${ }^{1} \mathrm{H}$ COSY experiment was performed. The same result with lower resolution spectra was obtained when ${ }^{t}$ BuXPhosAu ${ }^{+}$was generated in situ with one equivalent of ethynylbenzene.

Figure 16. ${ }^{1} \mathrm{H}_{-}{ }^{31} \mathrm{P}$ HMBC experiment of complex 37.

Furthermore, we analysed the evolution of those species when increasing the temperature by ${ }^{31} \mathrm{P}$ NMR spectroscopy recording the spectra every $20^{\circ} \mathrm{C}$ from $-60^{\circ} \mathrm{C}(213 \mathrm{~K})$ to room temperature (Figure 17).

[^43]$\square$

Figure 17. ${ }^{31}$ P NMR spectroscopy from - 60 to $25{ }^{\circ} \mathrm{C}$ : a) Pure E at 213 K ; b) Pure 67 at 213 K ; c) Reaction at 213 K ; d) Reaction at 213 K after 15 min ; e) Reaction at 233 K ; f) Reaction at $253 \mathrm{~K} ;$ g) Reaction at 273 K ; h) Reaction at 298 K ; i) Reaction at 298 K after 30 min.

In this manner, we could observe the consumption of [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{SbF}_{6}(\mathbf{E})$ while digold complex 67 was formed. On the other hand, complex 37 was no longer observed at $-20^{\circ} \mathrm{C}(253 \mathrm{~K})$.

## Determination of the Equilibrium Constant

Later on, we checked that the formation of digold complex 67 was a reversible process by calculating the equilibrium constant with complex $\mathbf{E}$ (Scheme 22). ${ }^{31}$ In this manner, we could prove that the resting state was coexisting with complex 37 (Scheme 19). Otherwise, we should consider an alternative active species and therefore a new catalytic cycle.

[^44]

Scheme 22. Equilibrium between complex E and digold complex 67.
Thus, we decided to apply the Van't Hoff equation in order to calculate the equilibrium constant. Considering that Gibbs energy can be decomposed in enthalpy and entropy factors (Equation 1) as well as be related to the equilibrium constant of the same process (Equation 2), Van't Hoff equation represents the relationship between this equilibrium constant and its enthalpy/entropy factors (Equation 3). Therefore, the ratio between reagents and products would vary only depending on the temperature.

$$
\Delta G^{0}=\Delta H^{0}-T \Delta S^{0}
$$

## Equation 1. Decomposition of Gibbs energy in $\Delta H^{0}$ and $\Delta S^{0}$.

$$
\Delta G^{0}=-R T \cdot \ln K_{e q}
$$

Equation 2. Relationship between Gibbs energy and $K_{e q}$.

$$
\ln K_{e q}=-\frac{\Delta H^{0}}{R T}+\frac{\Delta S^{0}}{R}
$$

## Equation 3. Van't Hoffe equation.

Concurrently, the equilibrium constant between [ ${ }^{t} \mathrm{BuXPhosAuNCMe}^{2} \mathrm{SbF}_{6}(\mathbf{E})$ and digold complex 67 could be represented as the quotient of their concentrations (Equation 4).

$$
\begin{aligned}
& K_{e q}=\frac{[\text { Digold Complex } \mathbf{6 7}] \cdot\left[\mathrm{HSbF}_{6}\right] \cdot\left[\mathrm{CH}_{3} \mathrm{CN}\right]^{2}}{[\text { Complex } \boldsymbol{E}]^{2} \cdot[\text { Ethynylbenzene }]} \\
= & \frac{4 \cdot[\mathbf{6 7}]^{4}}{\left.[\text { Complex } \mathbf{E}]_{0}-2 \cdot[\mathbf{6 7}]\right)^{2} \cdot\left([\text { Ethynylbenzene }]_{0}-[\mathbf{6 7}]\right)}
\end{aligned}
$$

## Equation 4. Equilibrium constant as a function of [67].

Therefore, reaction between [ ${ }^{t} \mathrm{BuXPhosAuNCMe}^{2} \mathrm{SbF}_{6}(\mathbf{E})$ with $0.5,1,2,3.5$ and 5 equiv. of ethynylbenzene in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ was analysed by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy at $10,5,20$ and $35^{\circ} \mathrm{C}$. Considering that we could measure the ratio between complex $\mathbf{E}$ and digold complex 67 under the different conditions, we could also determine their concentrations in the equilibrium (Equation 5).

$$
\text { Integrals Ratio }=\frac{[\text { Complex } \boldsymbol{E}]_{0}-2 \cdot[\mathbf{6 7}]}{[\mathbf{6 7}]}
$$

## Equation 5. Relationship between catalyst E and digold complex 67.

Accordingly, we could calculate the equilibrium constant at each temperature (Table 1).

> Table 1. Equilibrium constants depending on the temperature with increasing equiv. of ethynylbenzene. ${ }^{, b}$

${ }^{a}$ Scheme 22, equations 4 and $5 .{ }^{b}$ Equilibium constants (M).
Afterwards, we used these data for the Van't Hoff equation and we checked that fit in a linear regression with $\mathrm{R}^{2}=0.991$ (Figure 18). Thus, we concluded that the formation of digold complex 67 was indeed reversible and determined that the equilibrium constant at $50{ }^{\circ} \mathrm{C}$ was $1.08 \cdot 10^{-7} \mathrm{M}$. Moreover, we could calculate that the enthalpy of the process was $6.8 \mathrm{kcal} / \mathrm{mol}$ and the entropy $-11 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$.

Figure 18. Relationship between the equilibrium constant towards 67 and the temperature.

## 6. Reactivity of Digold Complexes

## Tests of the catalytic activity

Thereupon, we decided to prove whether digold complex 67 was catalytically involved in the formation of oxabicycle $\mathbf{3 6}$ (Table 2). The reaction was performed under the optimized conditions varying the stoichiometry and using half of the catalyst loading. No reaction was observed between 67 and 6 -methylhept-5-en-2-one under stoichiometric conditions (entry 1). Furthermore, under catalytic conditions using $2.5 \mathrm{~mol} \%$ of 67 , only $9 \%$ of $\mathbf{3 6}$ was observed after 19 h at $50^{\circ} \mathrm{C}$ (entry 2). Similarly, when switching the stoichiometry, only $8 \%$ was obtained after 4 days (entry 3 ).

Table 2. [2+2+2] Cycloaddition catalyzed by digold complex 67.

| Entry | Y mol\% | X equiv. | Additive | Yield $^{a}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 100 | 0 | - | - |
| $2^{b}$ | 2.5 | 3.5 | - | $9 \%$ |
| $3^{c}$ | 2.5 | 0.5 | - | $8 \%$ |
| 4 | 2.5 | $5^{d}$ | $\mathrm{HSbF}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ | $45 \%^{e}$ |
| 5 | - | $5^{d}$ | $\left(2.5 \mathrm{~mol}^{d} \%\right.$ <br> $\mathrm{HSbF}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ <br> $\left(2.5 \mathrm{~mol}^{d}\right)$ | - |

${ }^{a}$ Crude analysed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yield referred to oxabicycle 36. ${ }^{b}$ Dimerization of the alkyne was detected. ${ }^{c}$ Reaction time of 4 days. ${ }^{d}$ Proportion of the alkyne was increased to account for the competitive hydration. ${ }^{e}$ Isolated yield.

Nevertheless, when $\mathrm{HSbF}_{6}$ was added substoichiometrically, the equilibrium between the gold species was re-established allowing the formation of the active complex 37 and then, the reaction proceeded to give product $\mathbf{3 6}$ with slightly lower yield (Scheme 23).

## Scheme 23. Regeneration of gold complex 37 ( $L^{t}{ }^{t}$ BuXPhos).

Moreover, the same behaviour was observed in the reaction between 6-methylhept-5-en-2one and ethynylbenzene to form cyclobutene 69 and oxabicycle 70, which were described in Chapter 2 (Table 3). ${ }^{22}$ Traces of product 69 were observed performing the reaction with 67, stoichiometrically or catalytically, and the equilibrium was re-established in the presence of substoichiometric amounts of $\mathrm{HSbF}_{6}$ (entry 3).

Table 3. [2+2] Cycloaddition catalyzed by digold complex 67.

| Entry | Y mol\% | X equiv. | Additive | Yields (69:70) $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: | :---: | :---: |
| $1^{b}$ | 2.5 | 3.5 | - | $6 \%(6: 1)$ |
| $2^{c}$ | 2.5 | 0.5 | - | $9 \%(3.5: 1)$ |

| 4 | - | $5^{d}$ | $\mathrm{HSbF}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ <br> $\left(2.5 \mathrm{~mol}^{\mathrm{O}}\right)$ | - |

${ }^{a}$ Crude analysed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to cyclobutene 69 and oxabicycle 70. ${ }^{b}$ Dimerization of the alkyne was detected. ${ }^{c}$ Reaction time of 4 days. ${ }^{d}$ Proportion of the alkyne was increased to account for the competitive hydration. ${ }^{e}$ Isolated yield.

Finally, we attempted the gold-catalyzed reaction between 6-methylhept-5-en-2-one and other nucleophilies in order to exclude the activation of the oxoalkene as the key step of the process (Scheme 24). ${ }^{14}$ Thus, we used allyltrimethylsilane, indole, 1,3,5trimethoxybenzene and 1,3-diphenylpropane-1,3-dione but no reaction was observed in any case.

Scheme 24. Oxoalkene activation towards nucleophilic attack.
Therefore, we suggest the existence of a pre-equilibrium between [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{SbF}_{6}(\mathbf{E})$ and ethynylbenzene with complex 37 and digold complex 67 (Scheme 25). Complex 37 was the active species towards the nucleophilic attack of the oxoalkene to enter the catalytic cycle that led to oxabicycle 36. Thus, our results indicated that digold complex 67 acted as an unreactive resting state outside the catalytic cycle, sequestering most of the active gold(I) and lengthening the reaction times. This proposal could also explain the formation of the tetrahydrofuran byproduct 65 .

Scheme 25. Digold complex 67 as an off-cycle resting state.

## DFT calculations

Computationally, we determined the activation energy for the key nucleophilic attack of the oxoalkene to the ethynylbenzene moiety of the model digold complex 71 with $\mathrm{PMe}_{3}$ as ligand (Scheme 26). In this case, the activation energy was $25 \mathrm{kcal} / \mathrm{mol}, 10 \mathrm{kcal} / \mathrm{mol}$ higher than the attack to complex 42.

Scheme 26. Attack of the oxoalkene towards digold complex 71.
Moreover, the corresponding cyclopropyl gold carbene 72 would be $18.1 \mathrm{kcal} / \mathrm{mol}$ less stable than 71, in contrast to $1.2 \mathrm{kcal} / \mathrm{mol}$ for $\mathbf{5 1}$. Therefore, these results also suggested that digold complex 67 acts as a dead end.

## 7. Simultaneous Findings

While we were performing this study, other digold scaffolds were reported in the literature. An early example was digold complex 74 bearing an IPr ligand (Scheme 27). ${ }^{32,33}$ This was isolated when increasing the temperature of complex 73, which was generated in situ with ethynylbenzene, $\operatorname{IPrAuCl}$ and $\mathrm{AgSbF}_{6}$ and detected spectroscopically at $-78^{\circ} \mathrm{C}$.

## Scheme 27. Generation of digold complex 74.

Interestingly, digold complex 74 did not react with triflic acid but the corresponding alkynyl gold complex 75, generated by the addition of pyridine to form 76, led to the regeneration of ethynylbenzene building $\operatorname{IPrAuOTf}$ (Scheme 28). This result showed the robustness of this type of digold complexes.

## Scheme 28. Tests of the catalytic activity of 74.

Similar digold complexes with phosphine ligands were also detected in the intermolecular [2+2] cycloadditions of alkynes with alkenes. ${ }^{34}$ However, their role in catalysis was still unclear. Their involvement in the cycloisomerization of 1,6 -enynes was also examined. Experimental and computational work suggested that these types of $\sigma, \pi$-digold complexes were unreactive in these type of processes. ${ }^{3}$

The nature of the 3-centre 2 -electron interaction between $\mathrm{C}-\mathrm{Au}$ was also investigated by studying the equilibrium between aryl gold 77 and digold complexes 78 as a function of the electronic effects of the R - substituents in the aromatic ring and the counterions $\mathbf{A}^{-}$of the gold complex (Scheme 29). ${ }^{36,37}$ For this case, it was found that formation of $\mathbf{7 8}$ was

[^45]favoured with less coordinating counterions as well as with more electron-rich substrates supporting the proposal of an electrondeficient $\mathrm{Au}_{2} \mathrm{C}$ bond.

## Scheme 29. Electronic effects in the formation of digold complexes 78.

Afterwards, a mechanistic investigation of the gold-catalyzed intramolecular allene hydroalkoxylation revealed a reversible $\mathrm{C}-\mathrm{O}$ bond formation followed by a ratedetermining protodeauration (Scheme 30). ${ }^{38}$ Thus, in the transformation of $\mathbf{7 9}$ to 81, vinyl gold complex 82 and vinyl digold complex 83 were detected. After testing their reactivity, it was reasoned that digold complex $\mathbf{8 3}$ was an off-cycle catalyst reservoir.

Scheme 30. Mechanistic study of allene 80 hydroxylation.
Later on, reactions of o-alkynyl gold complexes with alkynes in intramolecular transformations leading to a new variety of interesting cyclic systems were also developed. ${ }^{39}$ As an example, dyine $\mathbf{8 4}$ was cyclized with BrettPhosAuNTf $\mathrm{F}_{2}(\mathbf{P})$ to form 1,2dihydrocyclopenta $[a]$ indene 85 (Scheme 31). ${ }^{40}$ The reaction was proposed to proceed by formation of alkynyl species $\mathbf{8 6}$, which evolved by attack of the $\sigma$-alkynyl gold to the $\pi$ activated non-terminal alkyne in a 5-endo-dig cyclization. The resulting gold vinylidene $\mathbf{8 7}$ could undergo a $\mathrm{C}-\mathrm{H}$ insertion followed by protodemetallation to form tricyclic structure 85.

[^46]It is interesting that, in contrast to the reactions between alkynes and alkenes, these type of diyne cyclizations were smoothly catalyzed with digold complexes via this novel alkyne dual activation.

Scheme 31. Dual activation of dyine 84.

## 8. Conclusions

In spite of the advances of gold catalysis, very little evidence had been provided regarding the mechanistic aspects of these transformations. This lacking was due to the challenge in the identification of the key intermediates involved in the complex pathways proposed. Therefore, we performed a detailed mechanistic study of the gold-catalyzed intermolecular $[2+2+2]$ cycloaddition of alkynes and oxoalkenes described in Chapter 2.

Monitoring of the reaction between ethynylbenzene and 6-methylhept-5-en-2one by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy showed the formation of digold complex 67 as the resting state of the process (Figure 15). ${ }^{22}$ Nevertheless, the tests performed to study the catalytic activity of 67 demonstrated that the structure was an unreactive structure outside the main catalytic cycle.

Figure 15. X-Ray crystal structure of digold complex 67.

Therefore, we checked that the formation of this digold complex was a reversible process by determining the equilibrium constant with catalyst $\mathbf{E}\left(\mathrm{K}_{\text {eq }}\left(50{ }^{\circ} \mathrm{C}\right)=1.08 \cdot 10^{-7} \mathrm{M}\right)$. Furthermore, we could detect the formation of complex 37 via low temperature NMR experiments. In this manner, we suggested a pre-equilibrium between those gold species before complex 37 entered the catalytic cycle (Scheme 19).

Scheme 19. Formation of digold complex 67 ( $L={ }^{t}$ BuXPhos).
Finally, complex 37 was simplified with $\mathrm{PMe}_{3}$ as ligand (42) in order to use DFT calculations to analyse the main catalytic cycle (Scheme 32). Thus, complex 42 suffered nucleophilic attack from the oxoalkene in the rate-determining step of the process (15.9 $\mathrm{kcal} / \mathrm{mol})$. The anti cyclopropyl gold carbene $\mathbf{5 1}$ was formed regio- and stereoselectively and underwent intramolecular nucleophilic attack of the ketone from the upper face of the ring building the oxonium cation 55.

Scheme 32. DFT calculations of the main catalytic cycle with PMe $_{3}$ (relative energies in kcal/mol).

The transformation was followed by a Prins-type cyclization towards the carbocation 56, which evolved to the coordinated product $57(-40.5 \mathrm{kcal} / \mathrm{mol})$. Ligand exchange with ethynylbenzene would regenerate complex 42 whereas releasing oxabicycle 36.

Isotopic labelling experiments also confirmed these results. Furthermore, they supported the formation of tetrahydrofuran $\mathbf{6 5}$ via an acid promoted cyclization of 6-methylhept-5-en-2-one to $\mathbf{6 3} / \mathbf{6 3}$ ' and $\mathbf{6 4}$ followed by trapping with alkynyl gold complex 68 (Scheme 33).

Scheme 33. Formation of tetrahydrofuran 65.

In summary, we suggest a stepwise process preceded by an equilibrium between different gold species towards the formation of 37 .

## Chapter 4:

## Anion Effects in Gold-Catalyzed Intermolecular Cycloadditions

## 1. Introduction

As mentioned in the General Introduction, the development of gold-catalyzed transformations relied on intramolecular reactions of functionalized $1, n$-enynes and their allene analogues. ${ }^{1}$ In contrast, the corresponding intermolecular processes were showed to be more challenging. ${ }^{2}$ Thus, involvement of different unsaturated substrates would imply competitive binding with the gold complex. Moreover, gold catalysts are inherently acidic and could promote polymerization of alkenes by cationic mechanisms. ${ }^{3}$

Therefore, the first intermolecular gold-catalyzed cycloaddition, developed in 2010, was based on the reaction of electron-rich alkynes and alkenes to build regioselective cyclobutenes (Scheme 1). ${ }^{4}$ Thus, ethynylbenzene and $\alpha$-methylstyrene formed cyclobutene 1 in $80 \%$ isolated yield when treated with a sterically hindered gold catalyst such as [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{SbF}_{6}(\mathbf{E})$.

Scheme 1. Gold-catalyzed [2+2] cycloaddition of alkynes with alkenes.
In Chapter 2, we presented the development of the intermolecular cascade [2+2+2] reaction between an alkyne, an alkene and a carbonyl group catalyzed by the same gold complex. ${ }^{5}$ As an example, the cycloaddition of $m$-methoxyethynylbenzene with 5-methylhex-5-en-2-one led to the oxabicycle scaffold $\mathbf{2}$ in $91 \%$ isolated yield (Scheme 2).

Scheme 2. Gold-catalyzed [2+2+2] cycloaddition towards oxabicycle 2.

[^47]It is interesting to note the differences between both optimized conditions: increased catalyst loading and temperature were required but also switching of the reaction stoichiometry. Thus, in the first case, an excess of the alkene was necessary partially due to its dimerization to $\mathbf{3}$ as a side-process and, in the second one, an excess of the alkyne due to the formation of trimer 4 as a side-product (Figure 1).

Figure 1. Side-products of the gold-catalyzed cycloadditions.
Based on analogy, the $[2+2]$ cycloaddition between alkynes and alkenes was proposed to proceed via highly distorted cyclopropyl gold carbenes such as $\mathbf{5 / 5}$ (Figure 2). ${ }^{6}$ The contribution of resonance form $5^{\prime}$ (a gold(I) stabilized carbocation) explained the regioselectivity of the transformation.

Figure 2. Highly distorted cyclopropyl gold carbene intermediate 5/5'( $\left.L^{\prime}={ }^{t} \boldsymbol{B u X P h o s}\right)$.
In Chapter 3, we presented a detailed mechanistic study of the intermolecular goldcatalyzed $[2+2+2]$ cycloaddition between ethynylbenzene and 5-methylhex-5-en-2-one. ${ }^{5} \mathrm{~A}$ step-wise catalytic cycle starting from gold complex 6 was suggested via DFT calculations and supported by monitoring of the reaction, low-temperature NMR studies, determination of equilibrium constants and isotopic labelling experiments (Scheme 3).

Scheme 3. Pre-equilibrium between gold species ( $L^{=}={ }^{\boldsymbol{B}}$ uXPhos).
Unreactive digold complex 7 was identified as the resting state of the transformation and we suggested a pre-equilibrium between the different gold species. Thus, we reasoned that

[^48]coordination of ethynylbenzene with gold formed complex 6, which made the terminal proton very acidic. Deprotonation of terminal alkynes with gold catalysts towards complexes such as $\mathbf{8}$ was already known. ${ }^{7}$ Coordination with a second molecule of the gold(I) complex formed the digold structure $7 .{ }^{8}$ This equilibrium could be modified by the ligand, the substrate and the counterion.

Tuning of the gold intermediates by the counterion has been used many times. In some examples, their influence could even modify the outcome of a transformation. This is the case of the gold-catalyzed synthesis of pyrroles from alkynyl aziridines (Scheme 4). ${ }^{9}$ Substrate 9 cyclized towards 2,5-substituted pyrrol 10 or 2,4-11 depending on the counterion of the gold catalyst.

## Scheme 4. Anion controlled regioselective synthesis of pyrroles.

The gold complex presumably coordinated to the alkyne (12), which would undergo intramolecular attack from the aziridine generating carbocation 13 (Scheme 5). Pyrrol 10 could be formed via direct proton elimination whereas pyrrole 11 via 1,2-aryl shift.

## Scheme 5. Common carbocationic intermediate $13\left(L=P h_{3} P\right)$.

The lower activity of tosylate was assigned to the tighter ion pair. Thus, in the presence of a basic counterion, proton elimination of $\mathbf{1 3}$ was facilitated and pyrrol $\mathbf{1 0}$ was favoured. In the absence of it, the proton transfer pathway was suggested to proceed mediating an aromatic or a weakly Lewis basic solvent. Consequently, triflate in toluene also formed $\mathbf{1 0}$ preferentially. On the other hand, triflate in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ would be insufficiently basic and the

[^49]1,2 -aryl shift took place towards $\mathbf{1 1}$. However, this behavior could also be related to the different dielectric constants. ${ }^{10}$

In other cases, the counterion could also influence in the efficiency of a transformation by increasing the yield towards the desired product or by changing the reaction rate. As an example, the gold-catalyzed hydroarylating aromatization of diyne $\mathbf{1 4}$ led to phenylnaphthalenes $\mathbf{1 5}$ and $\mathbf{1 6}$ when treated with catalysts $\mathbf{1 7}$ in benzene at $80^{\circ} \mathrm{C}$ (Scheme 6). ${ }^{11}$

Scheme 6. Gold-catalyzed hydroarylating aromatization.
Very different reaction rates towards 2-phenylnaphthalene 16 were observed when changing the counterion of catalyst $\mathbf{1 7}$. Monitoring the transformation with the different complexes showed great effiency for $\mathrm{PF}_{6}{ }^{-}$(Figure 3).

Figure 3. Reaction rates depending on the counterion of the catalyst 17.
Slightly lower reaction rates were detected for $\mathrm{BF}_{4}^{-}$or $\mathrm{NNf}_{2}{ }^{-} . \mathrm{NTf}_{2}^{-}$and $\mathrm{TsO}^{-}$still led to acceptable results, and very a slow conversion was detected for $\mathrm{SbF}_{6}{ }^{-}$. Very fast transformation was observed for $\mathrm{TfO}^{-}$but the reactivity drastically stopped around $60 \%$ yield.

[^50]Furthermore, important anion effects were observed in the enantioselectivity of several gold-catalyzed reactions. ${ }^{12}$ As an example, the hydroamination of allenes, $\mathbf{1 8}$ to $\mathbf{1 9}$, proceeded in very good yields when the cyclization was performed with ( $R$ )-xylylBINAP as the gold ligand in nitromethane at $50^{\circ} \mathrm{C}$ (Scheme 7). ${ }^{13}$

$3 \mathrm{~mol} \%(\mathrm{R})$-xylylBINAP( AuCl$)_{2} / 6 \mathrm{~mol} \% \mathrm{AgBF}_{4}: 82 \%, 1 \%$ ee $3 \mathrm{~mol} \%(R)$-xylyIBINAP(AuCl) ${ }_{2} / 3 \mathrm{~mol} \% \mathrm{AgBF}_{4}: 81 \%, 51 \%$ ee $3 \mathrm{~mol} \%(R)$-xylyIBINAP(AuOPNB) $2: 88 \%, 98 \%$ ee

## Scheme 7. Counterion-mediated enantioselective gold-catalyzed hydroamination of allenes.

However, the enatioselectivity of the reaction towards 19 was increased from 1 to $51 \% \mathrm{ee}$ when $3 \mathrm{~mol} \%$ of $\mathrm{AgBF}_{4}$ instead of 6 was added. Noteworthy, when $p$-nitrobenzoate ( $\mathrm{PNBO}^{-}$) was used as the counterion of the gold complex, the enantioselectivity of $\mathbf{1 9}$ increased to $98 \%$ ee. A detailed mechanistic study, based on DFT calculations, showed an important interaction between the substrate and the anion via hydrogen bonding, which explained the large effect in the enantioselectivity of the process.

Later on, the development and study of new weakly coordinating anions was expanded. ${ }^{14}$ These structures allowed the formation of highly soluble complexes due to the ion size prone to stabilize low charge species. These properties, along with the weak basicity and the stability in front of oxidation, formed robust Lewis acid-base adducts $\left[(L)_{n} M\right]^{+} X^{-}$.

The interionic structure of several ( $\pi$-alkyne)gold(I) ion pairs (20) was studied by ${ }^{1} \mathrm{H}^{-19} \mathrm{~F}$ HOESY NMR spectroscopy combined with DFT calculations. ${ }^{15}$ In all cases, the counterion was located close to the substrate but the specific distance strongly depended on the ligand on the metal. A new methodology, derived from diffusion NMR experiments and conductometry, was developed to determine the hydrodynamic volume of single ions as well as ion pairs. ${ }^{16}$ This showed that complexes bearing poorly electron donating ligands as 21 formed stronger ion pairs whereas lower interactions were observed for strongly electron donating ligands as 23 (Figure 4).

Figure 4. Distances between the anion and the substrate depending on the ligand.

[^51]These results were rationalized claiming that the electronic properties of the ligand finely tuned the charge accumulation on the alkyne and, consequently, its ability of attracting the anion.

Finally, when the same study was performed for NHC carbene ligands, it was observed that the position of that anion could be radically different. ${ }^{17}$ Thus, $\mathrm{BF}_{4}{ }^{-}$was placed next to the substrate in complex $\left[\mathrm{Ph}_{3} \mathrm{PAu}\left(\eta^{2} \text {-alkene }\right)\right]^{+} 24$ but on the other side of the ligand in complex $\left[\operatorname{IPAu}\left(\eta^{2} \text {-alkene) }\right]^{+} \mathbf{2 5}\right.$ (Figure 5).

24

25

Figure 5. Distinct positions of the anion depending on the ligand.

[^52]
## 2. Objectives

In this context, we focused on tuning the catalyst structure to minimize the generation of digold(I) complexes such as 7 during an intermolecular transformation, which are deadends of the catalytic cycle. In the cycloadditions involving alkynes, we reasoned that the use of more bulky, non-coordinating and less basic couterions could slow down the deprotonation and hamper the formation of the $\sigma$-acetylide gold(I) intermediates. Hence, we designed the synthesis of new gold complexes using $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$ as the anion, for example, $\mathbf{Q}$ or $\mathbf{R}$ bearing ${ }^{t} \mathrm{BuXPhos}$ and IPr ligands, respectively (Figure 6).

Figure 6. New gold(I) complexes using BAr ${ }_{4}{ }_{4}$.
We also performed a mechanistic study of the intermolecular [2+2] cycloaddition of alkynes with alkenes in order to further understand the influence of the counterion on the reactivity of these processes.

## 3. Synthesis and Reactivity of New Catalysts

## Anion Effect in the [2+2] Cycloaddition

The [2+2] cycloaddition of alkynes with alkenes towards cyclobutene $\mathbf{1}$ was originally developed using catalyst $\mathbf{E}$ (Scheme 1). ${ }^{4}$ As expected, the ligand had a strong influence on the selectivity but we decided to examine also the effect of changing the counterion (Table $1)$. The reaction was performed between ethynylbenzene and 2 equiv. of $\alpha$-methylstyrene under the optimized conditions. We synthesized successfully gold complex $\mathbf{Q}$ from the corresponding chloride and $\mathrm{NaBAr}_{4}{ }_{4}$ in $97 \%$ isolated yield as well as complexes bearing $\mathrm{BF}_{4}{ }^{-}(\mathbf{S})$ and $\mathrm{PF}_{6}{ }^{-}(\mathbf{T})$. Thus, we could observe notable differences between them in the synthesis of cyclobutene $\mathbf{1}$. Replacement of $\mathrm{SbF}_{6}^{-}$by $\mathrm{BAr}_{4}{ }_{4}^{-}$led to an increase of the isolated yield from 80 to $95 \%$ (entries 1 and 2).

Table 1. Screening of anions in the [2+2] cycloaddition.

| Entry | $\mathbf{A}^{-}$ | Yield $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{SbF}_{6}{ }^{-}$ | $80 \%$ |
| 2 | $\mathrm{BAr}^{-}{ }_{4}^{-}$ | $95 \%$ |
| 3 | $\mathrm{BF}_{4}{ }^{-}$ | $62 \%$ |
| 4 | $\mathrm{PF}_{6}{ }^{-}$ | $19 \%$ |
| $5^{b}$ | $\mathrm{NTf}_{2}{ }^{-}$ | $26 \%$ |
| $6^{b}$ | $\mathrm{TfO}^{-}$ | $18 \%$ |

${ }^{a}$ Crude analyzed by ${ }^{\mathrm{I}} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to cyclobutene 1. ${ }^{b}$ Catalysts generated in situ with ${ }^{t} \mathrm{BuXPhosAuCl}$ and the corresponding silver salts.

The use of $\mathrm{BF}_{4}{ }^{-}$gave 1 in lower but still acceptable yield (entry 3). However, more coordinating couterions as $\mathrm{NTf}_{2}^{-}$or $\mathrm{TfO}^{-}$afforded the [2+2] cycloaddition product very inefficiently (entries 5 and 6). Surprisingly, the use of $\mathrm{PF}_{6}{ }^{-}$formed cyclobutene 1 only in $19 \%$ yield (entry 4 ).

These results suggested that the anion has a significant effect in this reaction. Therefore, we examined the scope of the improvement achieved with gold complex $\mathbf{Q}$. The [2+2] cycloaddition between different terminal alkynes with $\alpha$-methylstyrene towards cyclobutenes such as 26 was performed changing $\mathrm{SbF}_{6}{ }^{-}$by $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$(Table 2). In most cases, yields using $\mathrm{BAr}_{4}^{\mathrm{F}}$ - were $10-30 \%$ higher (Table 2), with the exception of MeOsubstituted alkynes (entries 6,14 and 24) and with 3-thienyl alkyne (entry 26). Moreover, in the case of the cyclopropyl ring, a lower yield was obtained (entry 28).

Table 2. Alkyne scope in the [2+2] cycloadditon. ${ }^{a}$

| Entry | R- | $\mathrm{A}^{-}$ | Product | Yield ${ }^{\text {b }}$ |

| 18 |  | $\mathrm{BAr}{ }_{4}{ }^{\text {- }}$ | 34 | 98\% |
| 19 | $m-\mathrm{FC}_{6} \mathrm{H}_{4}-$ | $\mathrm{SbF}_{6}^{-}$ | 35 | 67\% |
| 20 |  | $\mathrm{BAr}{ }_{4}{ }^{\text {- }}$ | 35 | 77\% |
| 21 | $m-\mathrm{ClC}_{6} \mathrm{H}_{4}-$ | $\mathrm{SbF}_{6}$ | 36 | 60\% |
| 22 |  | $\mathrm{BAr}{ }_{4}{ }^{-}$ | 36 | 83\% |
| 23 | $o-\mathrm{MeOC}_{6} \mathrm{H}_{4}{ }^{-}$ | $\mathrm{SbF}_{6}{ }^{-}$ | 37 | 30\% |
| 24 |  | $\mathrm{BAr}{ }_{4}{ }^{-}$ | 37 | 24\% |
| 25 | 3-Thienyl- | $\mathrm{SbF}_{6}{ }^{-}$ | 38 | 84\% |
| 26 |  | $\mathrm{BAr}_{4}{ }^{-}$ | 38 | 86\% |
| $27$ | Cyclopropyl- | $\mathrm{SbF}_{6}$ | 39 | 46\% |
| 28 |  | $\mathrm{BAr}_{4}^{\mathrm{F}}{ }^{-}$ | 39 | 35\% |

${ }^{a}$ These experiments were performed by Anna Homs. ${ }^{b}$ Isolated yields.
Cyclobutene 1 could also be obtained in $95 \%$ yield by performing the reaction with complex $\mathbf{Q}$ on a larger scale ( 2.00 mmol ). Furthermore, generating the catalyst in situ by mixing ${ }^{t} \mathrm{BuXPhosAuCl}$ and $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}$ did not affect the yield.

We attempted the $[2+2]$ cycloaddition between novel alkynes and $\alpha$-methylstyrene using catalyst $\mathbf{Q}$. However, very complex mixtures were obtained for $o$-methylethynylbenzene, (bromoethynyl)benzene and ethynyltrimethylsilane (Figure 7). Only $11 \%$ of the cyclobutene product was detected for the 1,3-enyne 2-methylut-1-n-3-yne. And, in the case
of non-terminal alkynes, no reaction was observed for hex-3-yne, 1,2-diphenylethyne or prop-1-yn-1-ylbenzene. ${ }^{18}$

Figure 7. Expansion of the alkyne scope.
Improved yields were also obtained in general when ethynylbenzene was used with different alkenes to cyclobutenes 40 (Table 3). In these cases, the improvement ranged from 5 to $20 \%$ isolated yields. The reaction was also extended to allylsilanes (entries 5 and 6), allyl ethers (entries 7 and 8) and allylsilyl ethers (entries 9 and 10).

Table 3. Alkene scope of the [2+2] cycloaddition. ${ }^{a}$

| Entry | Alkene | $\mathrm{A}^{-}$ | Product | Yields |
| :---: | :---: | :---: | :---: | :---: |

| 9 | Me | $\mathrm{SbF}_{6}{ }^{-}$ | 45 | $21 \%{ }^{\text {c }}$ |
| 10 | $\mathrm{COSiPh}_{3}$ | $\mathrm{BAr}{ }_{4}{ }^{-}$ | 45 | $31 \%{ }^{\text {c }}$ |

${ }^{a}$ These experiments were performed by Anna Homs. ${ }^{b}$ Isolated yields. ${ }^{c}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to cyclobutenes 40.

Finally, the yield of the gold-catalyzed macrocyclization of 1,14-enyne 46 to form the 13membered derivative 47 was also improved from $57 \%$ isolated yield when using $\mathrm{SbF}_{6}{ }^{-}$to $82 \%$ with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$maintaining the optimized conditions (Scheme 8 ). ${ }^{19}$

[^53]

Scheme 8. Improved macrocyclization of 1,14-enyne 46.

## Expansion to Other Transformations

At the same time, the intermolecular gold-catalyzed synthesis of phenols 48 from terminal alkynes and an excess of furans, using $\operatorname{IPr}$ as ligand, was developed in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ (Table 4). ${ }^{20}$ Thus, the cycloaddition proceeded under very mild conditions and with moderate to good yields when using $[\operatorname{IPrAuNCMe}] \mathrm{SbF}_{6}(\mathbf{C})$. Then, the yields increased up to $36 \%$ for catalyst $\mathbf{R}$ bearing $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$(entry 4 ).

Table 4. Gold-catalyzed synthesis of phenols 48. ${ }^{\text {a }}$

| Entry | R- | $\mathrm{A}^{-}$ | Product | Yield ${ }^{\text {b }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Ph- | $\mathrm{SbF}_{6}{ }^{-}$ | 49 | 70\% |
| 2 |  | $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$ - | 49 | 85\% |
| 3 | $p-\mathrm{ClC}_{6} \mathrm{H}_{4}-$ | $\mathrm{SbF}_{6}^{-}$ | 50 | 50\% |
| 4 |  | $\mathrm{BAr}_{4}^{\mathrm{F}}{ }_{4}^{-}$ | 50 | 86\% |
| 5 | $m-\mathrm{MeOC}_{6} \mathrm{H}_{4}{ }^{-}$ | $\mathrm{SbF}_{6}{ }^{-}$ | 51 | 77\% |
| 6 |  | BAr ${ }_{4}{ }_{4}$ | 51 | 85\% |
| $7^{c}$ | $p-\mathrm{NO}_{2} \mathrm{C}_{6} \mathrm{H}_{4}-$ | $\mathrm{SbF}_{6}{ }^{-}$ | 52 | 37\% |
| 8 |  | $\mathrm{BAr}{ }_{4}^{\mathrm{F}}{ }^{-}$ | 52 | 66\% |
| 9 | $o-\mathrm{BrC}_{6} \mathrm{H}_{4}-$ |  | 53 | 45\% |
| 10 |  | $\mathrm{BAr}_{4}^{\mathrm{F}}-$ | 53 | 76\% |

${ }^{a}$ These experiments were performed by Núria Huguet and Dr. David Leboeuf. ${ }^{b}$ Isolated yields. ${ }^{c} 2,5-$ Dimethyl-3-(1-(4-nitrophenyl)vinyl)furan formed as a side-product.

Therefore, both the $[2+2]$ cycloaddition and the synthesis of phenols followed the same trend when using $\mathrm{BAr}^{\mathrm{F}} 4^{-}$. We also examined its influence in the $[2+2+2]$ cycloaddition of alkynes with oxoalkenes. ${ }^{5}$ We performed the reaction between ethynylbenzene and 5-methylhex-5-en-2-one towards the oxabicycle 54 under the optimized conditions screening different counterions (Table 5). In this case, very similar results were obtained with $\mathrm{SbF}_{6}{ }^{-}$ and $\mathrm{BAr}_{4}{ }_{4}^{-}$(Table 5). Moderate yields were observed for $\mathrm{BF}_{4}{ }^{-}$and $\mathrm{NTf}_{2}^{-}$and only traces of oxabicycle 54 were detected with $\mathrm{TfO}^{-}$.

[^54]Table 5. Screening of anions in the [2+2+2] cycloaddition.

| Entry | $\mathbf{A}^{-}$ | Yield $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: |
| 1 | $\mathrm{SbF}_{6}^{-}$ | $68 \%$ |
| 2 | $\mathrm{BAr}^{-}{ }^{-}$ | $72 \%$ |
| 3 | $\mathrm{BF}_{4}^{-}$ | $43 \%$ |
| $5^{b}$ | $\mathrm{NTf}_{2}^{-}$ | $40 \%$ |
| $6^{b}$ | $\mathrm{TfO}^{-}$ | $3 \%$ |

${ }^{a}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to oxabicycle 54. ${ }^{b}$ Catalysts generated in situ with 'BuXPhosAuCl and the corresponding silver salts.

Furthermore, we analysed the effect of other parameters of the reaction combined with $\mathrm{BAr}_{4}{ }_{4}{ }^{-}$(Table 6). Use of JohnPhos and IPr as ligands led to lower yields although they also improved with respect of $\mathrm{SbF}_{6}{ }^{-}$(entries 1 to 4 ). Use of 3 instead of $5 \mathrm{~mol} \%$ of catalyst $\mathbf{Q}$ dropped the yield to $52 \%$ (entry 5).

Table 6. Effect of other parameters. ${ }^{a}$

| Entry | Modification | $\mathrm{A}^{-}$ | Yield ${ }^{\text {b }}$ |
| :---: | :---: | :---: | :---: |
| I | JohnPhos | $\mathrm{SbF}_{6}{ }^{-}$ | 15\% |
| 2 | JohnPhos | $\mathrm{BAr}{ }_{4}^{\mathrm{F}}{ }^{-}$ | 33\% |
| 3 | IPr | $\mathrm{SbF}_{6}{ }^{-}$ | 15\% |
| 4 | IPr | $\mathrm{BAr} \mathrm{F}_{4}{ }^{-}$ | 27\% |
| 5 | $3 \mathrm{~mol} \%$ | $\mathrm{BAr} \mathrm{F}_{4}{ }^{-}$ | 52\% |
| 6 | $25^{\circ} \mathrm{C}$ | $\mathrm{BAr} \mathrm{F}_{4}{ }^{-}$ | 22\% |
| 7 | 1 equiv. | BAr ${ }_{4}{ }_{4}$ | 38\% |
| 8 | 0.25 equiv. | $\mathrm{SbF}_{6}{ }^{-}$ | 13\% |
| 9 | 0.25 equiv. | BAr ${ }_{4}{ }_{4}$ | 12\% |

${ }^{a}$ Continuation of Table $5 .{ }^{b}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using $1,4-$
diacetylbenzene as internal standard, yields referred to oxabicycle $\mathbf{5 4}$.
Decreasing the temperature to $25^{\circ} \mathrm{C}$ formed the oxabicycle $\mathbf{5 4}$ only in $22 \%$ yield (entry 6 ). Finally, performing the reaction with 1 equivalent of ethynylbenzene led to $38 \%$ yield and with an excess of oxoalkene only to $12 \%$, which was already observed for $\mathrm{SbF}_{6}{ }^{-}$(entries 7 , 8 and 9).

We examined the anion effect in the $[2+2+2]$ cycloaddition between different alkynes with 5 -methylhex-5-en-2-one towards 55 under the optimized conditions comparing $\mathrm{SbF}_{6}{ }^{-}$and $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$with catalyst $\mathbf{E}$ and $\mathbf{Q}$ (Table 7). In most of the examples, the yields varied very little (Table 7). A significant improvement was observed for $p$-chloroethynylbenzene and
$m$-ethynylphenol (entries 4 and 12). However, a drop of the yield was observed for $o$ ethynyltoluene (entries 22).

Table 7. Alkyne scope of the $[2+2+2]$ cycloaddition.

| Entry | R- | $\mathbf{A}^{-}$ | Product | Yield ${ }^{\text {a,b }}$ |
| :---: | :---: | :---: | :---: | :---: |

a Isolated yields. ${ }^{b}$ Conversion in brackets, $100 \%$ if not stated. ${ }^{c}$ Crude analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yields referred to oxabicycle $\mathbf{5 5}$. ${ }^{d}$ Switched reaction stoichiometry.

In the case of $p$-methoxyethynylbenzene, the same result was obtained with the standard excess but no improvement was observed when switching the stoichiometry of the reaction (entries $23 / 24$ and $25 / 26$ ). Therefore, the improvement was moderate for this more challenging cascade transformation. In general, a lower reaction conversion was observed, presumably as a result of a faster catalyst decay with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$than with $\mathrm{SbF}_{6}{ }^{-}$.

Finally, we tested the catalytic activity of $\mathrm{LAuCl} / \mathrm{NaBAr}_{4}^{\mathrm{F}}$ with several known intramolecular transformations. In the gold-catalyzed single cleavage rearrangement of 1,6-enyne 67 at $25^{\circ} \mathrm{C}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the cyclized product $\mathbf{6 8}$ and its isomer $\mathbf{6 9}$ were obtained in $67 \%$ yield (1:1.4) for $\mathrm{SbF}_{6}{ }^{-}$and $85 \%$ (11:1) for $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$(Scheme 9). ${ }^{21}$ Thus, both the yield and the selectivity were improved under these conditions.

Scheme 9. Gold-catalyzed single cleavage rearrangement of 67.
Later, dienyne 70 cyclized using $\mathrm{Ph}_{3} \mathrm{PAuCl}$ via the intramolecular cyclopropanation of the corresponding cyclopropyl gold carbene intermediate (Scheme 10). ${ }^{22}$ The reaction was performed at $-30^{\circ} \mathrm{C}$ for 20 min and tetracycle 71 was obtained quantitavely with $\mathrm{SbF}_{6}{ }^{-}$ and in $63 \%$ yield with $\mathrm{BAr}_{4}{ }_{4}{ }^{-}$. This transformation using $\mathrm{PPh}_{3}$ as the phosphine ligand was not more efficient by changing the counterion.

## Scheme 10. Cascade cyclization of dienyne 70.

Furthermore, we attempted the [4+2] cyclization of enyne 72 using phosphite 21 gold chloride under mild conditions to afford the tricyclic structure 73 (Scheme 11). ${ }^{6 \mathrm{a}}$ Interestingly, the reaction proceeded in very good yield with $\mathrm{SbF}_{6}{ }^{-}$but no reaction was observed when $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$was used.

Scheme 11. [4+2] Cycloaddition of enyne 72.

[^55]We reasoned that the sodium salt could not abstract the chloride from this gold complex, which would impede the generation of the active species. However, catalyst (21) AuCl could cyclize cycloheptatriene 74 to indene 75 using $\mathrm{SbF}_{6}{ }^{-}$or $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$with the same efficiency (Scheme 12). ${ }^{23}$ The reaction proceeded quantitavely in toluene at $0{ }^{\circ} \mathrm{C}$ via a complex mechanism through a gold-barbaralyl cation.

74
75
Scheme 12. Cyclization of cycloheptatriene 74.

[^56]
## 4. Kinetic Study of the [2+2] Cycloaddition

## Monitoring of the Transformation

Subsequently, we decided to study the particular involvement of the counterion in the $[2+2]$ cycloaddition of alkynes and alkenes. According to the previous theoretical work, ${ }^{6}$ the catalytic cycle was expected to proceed by a rate-determining attack of the electronrich alkene to the ( $\pi$-alkyne)gold complex 6 forming the cyclopropyl gold carbene 5/5' (Scheme 13). Then, the ring expansion would occur leading to benzylic carbocation 76, which would form the coordinated cyclobutene 77 after demetallation. A presumably associative ligand exchange with ethynylbenzene would close the catalytic cycle to cyclobutene $\mathbf{1}$ and complex $\mathbf{6}$.

Scheme 13. Initial proposal for the [2+2] cycloaddition ( $L^{=}{ }^{t}$ BuXPhos).
However, this approach did not contemplate the formation of digold complexes 7 and did not explain the counterion effect observed. ${ }^{5}$ Therefore, we monitored the [2+2] cycloaddition by ${ }^{1} \mathrm{H}$ NMR spectroscopy using ethynylbenzene and $\alpha$-methylstyrene under the optimized conditions, along with diphenylmethane as internal standard (Scheme 14).

## Scheme 14. Kinetic study of the [2+2] cycloaddition.

We performed these experiments using $\mathrm{SbF}_{6}^{-}(\mathbf{E}), \mathrm{BAr}_{4}{ }_{4}^{-}(\mathbf{Q})$ and $\mathrm{BF}_{4}{ }^{-}(\mathbf{S})$. The results confirmed a great dependence on the anion (Figure 8). Beside the differences in the final yields, the reaction rate increased with the bulkiness and the softness of the counterion.

Thus, $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$(Q) was faster than $\mathrm{SbF}_{6}{ }^{-}(\mathbf{E})$, which was faster than $\mathrm{BF}_{4}^{-}$ (S). In this case, no intermediates could be detected either, only the starting substrates and the final products could be observed.

Figure 8. Kinetic study of the [2+2] cycloaddition ( $L={ }^{t}$ BuXPhos).

## Order of the Reagents

We determined the order of the reagents of the rate equation to gain further insight into the mechanism applying the method of initial rates. ${ }^{24}$ In chemical kinetics, the rate of a reaction is proportional to the concentration of each reagent with specific exponents (Equation 1). Therefore, when all the components remain constant except one, it is possible to determine these values right in the beginning of the transformation.

$$
\begin{gathered}
A+B \rightarrow C \\
v_{0}=k \cdot[A]_{0}{ }^{a} \cdot[B]_{0}{ }^{b} \\
{[B]_{0}=\text { Constant }} \\
v_{0}=k^{\prime} \cdot[A]_{0}{ }^{a}
\end{gathered}
$$

## Equation 1. Rate equation of a reaction.

Then, when the initial rates $\left(v_{0}\right)$ are determined, it is possible to calculate the order of the reagents by gradually modifying the initial concentration of the substrate ( $[\mathrm{A}]_{0}$ ) and plotting the logarithm of the results (Equation 2).

$$
\ln \left(v_{0}\right)=\ln \left(k^{\prime}\right)+a \cdot \ln \left([A]_{0}\right)
$$

## Equation 2. Determination of the order of the reagents.

The initial rates can be measured as the variation of the product concentration in time when the conversion is smaller than 10-15\% (Equation 3).

[^57]$$
v_{0}=\frac{d[C]}{d t} \text { where }[C] \sim 10-15 \%
$$

## Equation 3. Determination of the initial rate.

Thus, we monitored the [2+2] cycloaddition between ethynylbenzene and $\alpha$-methylstyrene using catalyst $\mathbf{Q}$ under the optimized conditions in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ by ${ }^{1} \mathrm{H}$ NMR spectroscopy with dipheylmethane as internal standard (Scheme 15). Methods using IR, GC or HPLC led to less reliable results.

## Scheme 15. Method of the initial rates.

To start, we used 0.50 mmol of alkene together with $7.2 \mu \mathrm{~mol}$ of catalyst in 0.56 mL of $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ varying the quantities of ethynylbenzene and we determined the formation of cyclobutene 1 with time (Figure 9). We could observe that the reaction was faster by increasing the initial amount of ethynylbenzene.

Figure 9. Variation of the alkyne.
Then, we performed the reaction with 0.25 mmol of alkyne and modifying the excess of $\alpha$ methylstyrene (Figure 10). Although it was assumed that the nucleophilic attack of the alkene towards the activated alkyne was the rate-determining step of the process, the effect of $\alpha$-methylstyrene was almost non-existent.

Figure 10. Variation of the alkene.
Finally, we kept 0.25 mmol of ethynylbenzene and 0.50 mmol of $\alpha$-methylstyrene in order to determine the effect of the catalyst loading (Figure 11). In this case, the differences in the formation of cyclobutene 1 were significant.

Figure 11. Variation of the catalyst.
With these results and according to the method described, we plotted the initial rates depending on the initial concentration of each substrate (Figure 12). We could observe first order for both ethynylbenzene and for catalyst $\mathbf{Q}$, whereas the reaction showed zero order dependence for $\alpha$-methylstyrene. This result contradicted the initial proposal, which involved the alkene in the rate-determining step of the catalytic cycle.

Figure 12. Order of the reagents in the [2+2] cycloaddition.
Furthermore, to confirm these results, we performed a kinetic experiment studying the effect of the ratio alkene:alkyne under the optimized conditions (Scheme 16).

## Scheme 16. Kinetic study depending on the stoichiometry.

Thus, the $[2+2]$ cycloaddition between ethynylbenzene and $\alpha$-methylstyrene was monitored by ${ }^{1} \mathrm{H}$ NMR spectroscopy using dipheylmethane as internal standard. The rate of cyclobutene 1 formation was compared with the ratio alkene:alkyne using 5:1, 2:1 and 5:2 as examples (Figure 13). We could observe that the rate between the two first experiments was almost the same but they showed a significant difference with the last one, therefore, the rate of the [2+2] cycloaddition did not depend on the concentration of $\alpha$-methylstyrene.

Figure 13. Kinetic study depending on the stoichiometry.
Accordingly, further studies were necessary to resolve the formation of cyclobutene $\mathbf{1}$ as the kinetic experiments showed a more complicated scenario than the DFT calculations had provided (Scheme 13). ${ }^{4}$

## 5. Involvement of Digold Complexes

## Crystallization of Intermediates

Analysis of the reaction mixture by ${ }^{31} \mathrm{P}$ NMR spectroscopy showed a digold scaffold analogous to 7, along with another new gold(I) complex. Crystallization of the reaction mixture with pentane led to $\left[\left({ }^{t} \mathrm{BuXPhosAu}\right)_{2} \mathrm{CCPh}\right] \mathrm{BAr}^{\mathrm{F}}$ (78) together with ( $\pi$-alkene) gold(I) complex 79 (Figures 14 and 15, respectively).

Figure 14. X-Ray crystal structure of digold complex 78.

Figure 15. X-Ray
crystal structure of $(\pi-$ alkene)gold complex 79.

The main divergence between digold complex with $\mathrm{SbF}_{6}{ }^{-} 7$ (Figure 16, see Chapter 3 for further information) and structure $\mathbf{7 8}$ in the solid state was the radically different position of the counterions. Whereas $\mathrm{SbF}_{6}{ }^{-}$was located between both gold atoms bending slightly the cation entity, $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$was located alongside the ethynylbenzene moiety in the same plane. Thus, the angle of the $\pi$-coordinated gold(I) atom, the alkyne and the counterion was $130.3^{\circ}$ for $\mathrm{BAr}_{4}{ }_{4}^{-}$ and $77.3^{\circ}$ for $\mathrm{SbF}_{6}^{-}$leading to rather significantly distinct distances with the metal: $\mathrm{Au}-\mathrm{B}$ was $10.22 \AA$ while $\mathrm{Au}-\mathrm{Sb}$ was $8.23 \AA$. On the other hand, the angle with the $\sigma$-gold(I) atom was $210.0^{\circ}$ for $\mathrm{BAr}_{4}{ }_{4}^{-}$and $60.6^{\circ}$ for $\mathrm{SbF}_{6}{ }^{-}$leading even more different distances: $\mathrm{Au}-\mathrm{B}$ was $11.52 \AA$ and $\mathrm{Au}-\mathrm{Sb}, 7.34 \AA$.

Figure 16. X-Ray crystal structure of digold complex 7

To recapitulate, the digold complex as well as the ( $\pi$-alkene) gold coordination were observed during the monitoring of the [2+2] cycloaddition when using $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$ ( $\mathbf{7 8}$ and 79, respectively) but also with $\mathrm{SbF}_{6}^{-}$( 7 and $\mathbf{8 0}$, respectively) and $\mathrm{BF}_{4}^{-}$( $\mathbf{8 1}$ and 82, respectively).$^{25}$ Nevertheless, the ratios changed dramatically with the counterion: $[80] /[7]$ $\left(\mathrm{SbF}_{6}{ }^{-}\right)$dropped to 30 from $[\mathbf{7 9}] /[\mathbf{7 8}]=115\left(\mathrm{BAr}_{4}{ }_{4}^{-}\right)$and finally to 4 for $[\mathbf{8 2}] /[\mathbf{8 1}]\left(\mathrm{BF}_{4}^{-}\right)$. Thus, the ratio between those species grew following a clear trend: $\mathrm{BAr}_{4}{ }_{4}^{-}>\mathrm{SbF}_{6}{ }^{-}>\mathrm{BF}_{4}{ }^{-}$, resulting in a larger reservoir of the cationic gold(I) species by increasing the bulkiness and the softness of the counterion (Figure 17).

$78\left(\mathbf{A}^{-}=\mathrm{BArF}_{4}^{-}\right)$
$7\left(\mathbf{A}^{-}=\mathrm{SbF}_{6}^{-}\right)$
$81\left(\mathbf{A}^{-}=\mathrm{BF}_{4}^{-}\right)$

$79\left(\mathrm{~A}^{-}=\mathrm{BAr}^{-}{ }^{-}\right)$
$80\left(\mathrm{~A}^{-}=\mathrm{SbF}_{6}{ }^{-}\right)$
$82\left(\mathrm{~A}^{-}=\mathrm{BF}_{4}{ }^{-}\right)$

Figure 17. Ratio of the gold species dependant on the counterion.
Moreover, we prepared independently alkynyl gold complex 8 in $99 \%$ isolated yield by reaction of the gold chloride with pre-formed lithium phenylacetylide in THF (Scheme 17).

## Scheme 17. Synthesis of alkynyl gold complex 8.

Crystallization in pentane showed a neutral structure with Au-C $2.04 \AA$ (Figure 18).

Figure 18. X-Ray crystal structure of alkynyl gold complex 8.

[^58]Anion Effects in Gold-Catalyzed Intermolecular Cycloadditions

## Low Temperature NMR Experiments

These results suggested that the concentration of the catalytically active species 6 changed with the counterion, which should be higher with more bulky anions as $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$(83). In order to study the evolution between the different gold complexes $\mathbf{Q}, \mathbf{8 3}, 78$ and $\mathbf{8}$, we analysed the reaction between 10 equiv. of ethynylbenzene and catalyst $\mathbf{Q}$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ( 0.04 M) at $-78{ }^{\circ} \mathrm{C}$ by ${ }^{31} \mathrm{P}$ NMR spectroscopy (Scheme 18). ${ }^{8 \mathrm{~d}}$

Scheme 18. Study of gold complex 83.
At $-60^{\circ} \mathrm{C}$, complexes $\mathbf{Q}$ and $\mathbf{8 3}$ could be detected but no digold complex $\mathbf{7 8}$ was observed (Figure 19). The temperature was increased slowly to $20^{\circ} \mathrm{C}$ while catalyst $\mathbf{Q}$ was consumed. Digold complex 78 was not observed until $0^{\circ} \mathrm{C}$ and the catalytically active species 83 was clearly observed up to the same temperature. On the other hand, when using $\mathrm{SbF}_{6}$-, we could observe complex 7 at $-60^{\circ} \mathrm{C}$, becoming the only species at $-20^{\circ} \mathrm{C}$ (Figure 20, see Chapter 3 for further information). ${ }^{5}$

Figure 19. ${ }^{31} \mathrm{P}$ NMR spectroscopy from - 60 to $25{ }^{\circ} \mathrm{C}\left(\mathrm{BAFr}^{\mathrm{F}}{ }_{4}\right)$ : a) Reaction at 213 K ; b) Reaction at 233 K ; c) Reaction at 253 K ; d) Reaction at 273 K ; e) Reaction at 293 K.

Figure 20. ${ }^{31}$ P NMR spectroscopy from - 60 to $25{ }^{\circ} \mathrm{C}\left(\mathrm{SbF}_{6}^{-}\right)$: a) Pure E at 213 K ; b) Pure 7 at 213 K ; c) Reaction at 213 K ; d) Reaction at 213 K after 15 min ; e) Reaction at 233 K; f) Reaction at 253 K ; g) Reaction at 273 K ; h) Reaction at 298 K; i) Reaction at 298 K after 30 min.

Therefore, the deprotonation of terminal alkynes was more favoured when $\mathrm{SbF}_{6}^{-}$was used as the counterion and digold structure 7 was the predominant species (Scheme 19). Otherwise, the life-time of the $\pi$-coordinated alkyne complex was longer with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}(\mathbf{8 3})$.

Scheme 19. Gold species formed with ethynylbenzene ( $L==^{t}$ BuXPhos).

## DFT Calculations

Firstly, in order to gain further information of the nature of the ( $\pi$-alkyne) gold complexes 6 and 83, we performed DOSY and ${ }^{1} \mathrm{H}-{ }^{19} \mathrm{~F}$ HOESY NMR spectroscopy experiments. ${ }^{14,15,16}$ However, all the attempts led to non-conclusive results because of the low resolution spectra obtained.

Afterwards, by means of DFT calculations (M06, 6-31G(d) (C, H, P, B, F) and SDD (Au, Sb ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ), we studied these complexes to determine their steric and electronic features. We also calculated [ ${ }^{t} \mathrm{BuXPhosAu}\left(\eta^{2}\right.$-ethynylbenzene $\left.)\right] \mathrm{BF}_{4}$ (84) in order to determine a trend. First, we evidenced the steric congestion around the substrate hampering its deprotonation depending on the counterion. Later, we analysed the charge distribution by the electron density of the complexes mapped with ESP ( $\rho=0.03 \mathrm{e}^{3}$ ) and the positive charge was widely distributed around the ligand instead of being concentrated in the metal centre for 83, 6 and 84 (Figures 21, 22 and 23, respectively).

Figure 21. ESP of ( $\eta^{2}$-ethynylbenezene)gold complex 83 ( $\delta^{+}$in blue and $\delta^{-}$in red).

Figure 22. ESP of complex 6 ( $\delta^{+}$in blue and $\delta^{-}$in red).

Figure 23. ESP of complex 84 ( $\delta^{+}$in blue and $\delta^{-}$in red).

We also checked the pattern between the bulkiness of the counterion and the acidity of ethynylbenzene by determining the Mulliken atomic charges. The electron density decreased with the anion size $\left(\mathrm{BF}_{4}^{-}<\mathrm{SbF}_{6}^{-}<\mathrm{BAr}_{4}{ }_{4}^{-}\right)$, although the differences were modest: $0.250(\mathbf{8 4}), 0.243(\mathbf{6})$ and $0.237(\mathbf{8 3})$. Therefore, we reasoned that the large cation formed a more stable ( $\pi$-alkyne)complex with a softer counterion, for example, $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$.

## Determination of the Equilibrium Constants

Therefore, we decided to determine the equilibrium constant between catalyst $\mathbf{Q}$ and digold complex 78 using the Van't Hoff equation (Table 8). ${ }^{26}$ In the case of $\mathrm{SbF}_{6}{ }^{-}, \mathrm{K}_{\mathrm{eq}}$ $\left(50^{\circ} \mathrm{C}\right)=1.08 \cdot 10^{-7} \mathrm{M}$ and $\mathrm{K}_{\mathrm{eq}}\left(25^{\circ} \mathrm{C}\right)=4.44 \cdot 10^{-8} \mathrm{M}$ (see Chapter 3). ${ }^{5}$ Thus, we performed the reaction between gold complex $\mathbf{Q}$ and $0.5,1,2,3.5$ or 5 equiv. of ethynylbenzene in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$ analysing the formation of 78 at $-10,5,20$ and $35{ }^{\circ} \mathrm{C}$ by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy. Then, we calculated the equilibrium constant at each temperature, and we used these data for the Van't Hoff equation by plotting the logarithm of $\mathrm{K}_{\mathrm{eq}}$ with the inversed temperature and we checked that fit in a linear regression with $\mathrm{R}^{2}=0.987$ (Figure 24).

Table 8. Equilibrium constants between catalyst $Q$ and digold complex 78 depending on the temperature with increasing equivalents of
ethynylbenzene. ${ }^{a}$

$$
\begin{aligned}
& \text { Q } \\
& +\mathrm{HSbF}_{6}+2 \mathrm{CH}_{3} \mathrm{CN}
\end{aligned}
$$

In that case, the equilibrium constant at $25^{\circ} \mathrm{C}$ towards the digold complex 78 was $2.44 \cdot 10^{-8}$ M . Therefore, we could observe that, although the difference is rather small, the deprotonation of the alkyne was more favoured with $\mathrm{SbF}_{6}{ }^{-}$than with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$, probably due to the lower stability of the bulkier conjugated acid. Moreover, we could calculate that the difference of enthalpy of the process was $13.4 \mathrm{kcal} / \mathrm{mol}$ and the entropy $10 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$. Indeed, the enthalpy of this reaction was higher than with $\mathrm{SbF}_{6}{ }^{-}(6.8 \mathrm{kcal} / \mathrm{mol})$ although the entropy was slightly larger ( $-11 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$ ).

[^59]

Figure 24. Relationship between the equilibrium constant towards 78 and the temperature.

Furthermore, using the same methodology, we compared the tendency of the cationic gold complex to coordinate to $\alpha$-methylstyrene by determining the equilibrium constant towards 79 and $\mathbf{8 0}$. Reaction between $\mathbf{E}$ or $\mathbf{Q}$ and $0.5,1,2,3.5$ or 5 equiv. of the alkene in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ $(0.5 \mathrm{M})$ were also examined at $-10,5,20$ and $35^{\circ} \mathrm{C}$ by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy (Scheme 20).

Scheme 20. Equilibrium between the cationic gold complex and the $\pi$-alkene coordination.

Accordingly, the equilibrium constant towards 79, or 80, was simpler (Equation 4). Considering that we could measure the ratio between complex 79 and catalyst $\mathbf{Q}$ under the different conditions, we could also determine their concentrations in the equilibrium (Equation 5). Analogously, we determined them for $\mathbf{8 0}$ as well.

$$
\begin{gathered}
K_{\text {eq }}=\frac{[\mathbf{7 9}] \cdot\left[C H_{3} \mathrm{CN}\right]}{[\mathbf{Q}] \cdot[\alpha-\text { methylstyrene }]} \\
=\frac{[\mathbf{7 9}]^{2}}{\left([\mathbf{Q}]_{0}-[\mathbf{7 9}]\right) \cdot\left([\alpha-\text { methylstyrene }]_{0}-[\mathbf{7 9}]\right)}
\end{gathered}
$$

Equation 4. Equilibrium constant as a function of [79].

$$
\text { Integrals Ratio }=\frac{[79]}{[\mathbf{Q}]_{0}-[79]}
$$

Equation 5. Relationship between catalyst $Q$ and alkene complex 79.

Thus, we calculated the equilibrium constants at each temperature for $\mathrm{BAr}_{{ }_{4}}{ }^{-}$and $\mathrm{SbF}_{6}{ }^{-}$ (Tables 9 and 10, respectively). Then, we plotted the Van't Hoff equation and checked that it fit in a linear regression with $\mathrm{R}^{2}=0.964$ for $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$ and $\mathrm{R}^{2}=0.927$ for $\mathrm{SbF}_{6}{ }^{-}$(Figures 25 and 26 , respectively).

${ }^{a}$ Scheme 20 with $\mathrm{A}^{-}=\mathrm{SbF}_{6} \cdot{ }^{-b}$ Equilibium constants (no units).
With these results we could determine the equilibrium constants at $25^{\circ} \mathrm{C}$ : $\mathrm{K}_{\mathrm{eq}}\left(\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}\right)=$ 0.090 and $\mathrm{K}_{\mathrm{eq}}\left(\mathrm{SbF}_{6}{ }^{-}\right)=0.047$. In this case, we observed that the binding to $\alpha$ methylstyrene was stronger with bulky counterions, although the differences were small again. However, their comparison with respect to the formation of the digold complexes was remarkably distinct: the constants increased from $10^{-8}$ to $10^{-2}$.

Figure 25. Relationship between the equilibrium constant towards 79 and the temperature.

Figure 26. Relationship between the equilibrium constant towards 80 and the temperature.

In this case, the equilibrium was an exothermic process and the difference rather minor: $\Delta \mathrm{H}=-1.4 \mathrm{kcal} / \mathrm{mol}$ for $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$and $\Delta \mathrm{H}=-1.0 \mathrm{kcal} / \mathrm{mol}$ for $\mathrm{SbF}_{6}{ }^{-}$. The entropy was -11 and $-8 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$, respectively .

Consequently, the initial proposal should be modified considering this pre-equilibrium described. According to the equilibrium constants, catalyst $\mathbf{Q}$ ought to bind preferentially to $\alpha$-methylstyrene forming 79 in the presence of ethynylbenzene decreasing the concentration of $\mathbf{8 3}$ and $\mathbf{7 8}$ (Scheme 21). The extent of this effect would depend on the nucleophilicity of the alkene as well as the ratio of reagents of the reaction, as observed.

Scheme 21. Equilibrium between gold species including $\pi$-alkene coordination ( $L={ }^{t} \boldsymbol{B} \boldsymbol{u X P h o s}$ ).

The same scenario must be expected with $\mathrm{SbF}_{6}{ }^{-}$but the equilibrium between the corresponding gold species $(\mathbf{E}, \mathbf{8 0}, \mathbf{6}, \mathbf{8}$ and 7) would be more shifted towards the digold complex 7, which would explain the results observed during the kinetic study and the low temperature NMR experiments.

At this point, we decided to determine if complex 79 and $\mathbf{8 3}$ were also in direct equilibrium, which would clarify if the coordination of the alkene was inhibiting the [2+2] cycloaddition or storing cationic gold(I) reservoirs.

## Test of the Catalytic Activity

We performed some additional experiments to exclude other mechanistic pathways. We started by reacting the isolated intermediates under stoichiometric conditions with $\alpha$ methlstyrene. Thus, gold complex $\mathbf{8}$ was submitted to the [2+2] cycloaddition with 2 equiv. of the alkene in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25^{\circ} \mathrm{C}$ and no reaction was observed (Scheme 22). The same result was observed when the reaction was performed in the presence of $3 \mathrm{~mol} \%$ of catalyst Q.

Scheme 22. Stoichiometric experiments with gold complex 8.
The same tests were performed with digold complex 78 and no [2+2] cycloaddition was observed either (Scheme 23).

Scheme 23. Stoichiometric experiments with digold complex 78.
On the other hand, ( $\pi$-alkene) gold complex 79 reacted with ethynylbenzene under the optimized conditions in the absence of catalytic $\mathbf{Q}$ and afforded cyclobutene $\mathbf{1}$ in $72 \%$ isolated yield (Scheme 24).

## Scheme 24. Stoichiometric experiment with gold complex 79 ( $L={ }^{t}$ BuXPhos).

However, no cycloaddition was observed between 79 with alkynyl gold complex 8 (Scheme 25). These results demonstrated that ( $\pi$-alkene)gold species 79 could exchange with ethynylbenzene to regenerate the reaction towards $\pi$-coordination of the alkyne (83).

Scheme 25. Ending of the reactivity of gold complex 79 ( $L=^{t}$ BuXPhos).

Subsequently, we used complexes 8, 78 and 7 as catalysts for the [2+2] cycloaddition between ethynylbenzene with 2 equiv. $\alpha$-methylstyrene in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Table 11). These experiments proved that digold complex 7 was an unreactive resting state in the intermolecular gold-catalyzed $[2+2+2]$ cycloaddition between alkynes and oxoalkenes (see Chapter 3 for further information). In this case, complexes 8, 78 and 7 were very inefficient in the absence of any additive. Complex $\mathbf{8}$ was completely inactive (entry 1 ) and digold complexes 78 and 7 were very poor catalysts (entries 2 and 3). Nevertheless, the catalytic activity was restored upon addition of $\mathrm{HSbF}_{6}$, which cleaved the $\mathrm{Au}-\mathrm{C}$ bond regenerating the equilibrium between the gold(I) species towards 6 . Thus, reaction between ethynylbenzene and $\alpha$-methylstyrene with $\mathbf{8}$ or $\mathbf{7}$ and substoichiometric amounts of $\mathrm{HSbF}_{6}$ proceeded smoothly under the optimized conditions towards cyclobutene 1 in 75 and $79 \%$ isolated yield, respectively (entries 4 and 5).

Table 11. [2+2] Cycloaddition catalyzed by the isolated gold intermediates.

| Entry | [ Au ] | X mol\% | Additive | Yield ${ }^{\text {a }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 8 | 3 | - | - |
| 2 | 78 | 1.5 | - | 13\% |
| 3 | 7 | 1.5 | - | 13\% |
| 4 | 8 | 3 | $\begin{gathered} \mathrm{HSbF}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O} \\ (3 \mathrm{~mol} \%) \end{gathered}$ | $75 \%{ }^{\text {b }}$ |
| 5 | 7 | 1.5 | $\begin{gathered} \mathrm{HSbF}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O} \\ (1.5 \mathrm{~mol} \%) \\ \hline \end{gathered}$ | $79 \%{ }^{\text {b }}$ |

${ }^{a}$ Crude analysed by ${ }^{1} \mathrm{H}$ NMR spectroscopy using 1,4-diacetylbenzene as internal standard, yield referred to cyclobutene $\mathbf{1}$. ${ }^{b}$ Isolated yield.

On the other hand, when ${ }^{t} \mathrm{BuXPhosAuCl}$ reacted with $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}$ in the absence of a substrate, only one chloride abstraction occurred and digold complex $\mathbf{8 5}$ with a chloride bridge could be crystallized (Figure 27). ${ }^{27}$

[^60]

Figure 27. Formation of digold chloride bridge 85.
Finally, we attempted the gold-catalyzed reaction between $\alpha$-methylstyrene and other nucleophilies in order to exclude the activation of the alkene as the key step of the process (Scheme 26). Thus, we used 0.5 equiv. allyltrimethylsilane, indole, 1,3,5trimethoxybenzene or 1,3-diphenylpropane-1,3-dione in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ but no reaction was observed in any case.

Scheme 26. Alkene activation towards nucleophilic attack.
These results suggested that the active gold species was $\left[{ }^{t} \operatorname{BuXPhosAu}\left(\eta^{2}\right.\right.$ ethynylbenzene) $\mathrm{BAr}_{4}{ }_{4}(83)$, which entered the catalytic cycle via nucleophilic attack of $\alpha$ methylstyrene to $\mathbf{8 6}$ followed by ring expansion (87) and demetallation (88). Thus, the coordinated product would enter into the equilibrium and 79 would be recovered after ligand exchange with $\alpha$-methylstyrene releasing cyclobutene 1 (Scheme 27). Analogously, complexes $\mathbf{6}$ and $\mathbf{8 4}$ would be the active species when using $\mathrm{SbF}_{6}{ }^{-}$and $\mathrm{BF}_{4}{ }^{-}$, respectively.

Scheme 27. Complete proposal for the [2+2] cycloaddition ( $L={ }^{t} \boldsymbol{B} \boldsymbol{B}$ XPhos).
Accordingly, the ligand exchange between complex 79 and ethynylbenzene to form the key intermediate $\mathbf{8 3}$ was the rate-determining step of the catalytic cycle. Therefore, the orders for the catalyst and the alkyne were close to 1 and we observed zero-dependence for $\alpha$-methylstyrene. Thus, the coordination of the alkene would be more favoured (order 1) but exchange with the alkyne would be necessary to continue the catalytic cycle (order -1 ), which would formally be order 0 . Simultaneously, digold complex 78 would be competitively formed as a minor inactive byproduct via a side-pathway based on the deprotonation of the alkyne. Hence, this was an off-cycle intermediate decreasing the concentration of the active species.

## 6. Conclusions

During the mechanistic study of the gold-catalyzed intermolecular [2+2+2] cycloaddition of alkynes with oxoalkenes described in Chapter 3, the formation of unreactive digold species outside the main catalytic cycle was revealed. ${ }^{5}$ Thus, the activation of alkynes could competitively undergo deprotonation to form an alkynyl gold complex, which was detrimental for the efficiency of the transformation. Therefore, a new generation of gold(I) complexes bearing bulky, non-coordinating and less basic counterions, for example catalyst $\mathbf{Q}$, were designed in order to refine the selectivity in the intermolecular cycloadditions (Figure 28). ${ }^{28}$ Study of its efficiency showed improvements of the yields up to $36 \%$. The reactivity was compared in the [2+2] cycloaddition between alkynes and alkenes, the macrocyclization of large enynes, the $[2+2+2]$ cycloaddition of alkynes and oxoalkenes, the synthesis of phenols as well as in intramolecular reactions.

Figure 28. New gold complex $Q$ using $\mathrm{BAr}^{\mathrm{F}} \mathrm{i}_{4}$.
A detailed mechanistic study of the $[2+2]$ cycloaddition between ethynylbenzene and $\alpha$ methylstyrene using catalyst $\mathbf{Q}$ revealed a complex pre-equilibrium between different gold species before the $\pi$-coordinated alkyne $\mathbf{8 3}$ entered the catalytic cycle (Scheme 28). Preferential coordination of the alkene (79) was observed under the reaction conditions. Determination of the equilibrium constants with $\mathbf{Q}$, contrasting it with digold 78 formation, showed that this was indeed more favoured. Nevertheless, we could prove this was not inhibiting the formation of cyclobutene $\mathbf{1}$ by performing tests of the catalytic activity with the isolated gold intermediates. This scenario was confirmed by studying the evolution of these species with low-temperature NMR experiments, monitoring of the reaction and55 determination the order of the reagents. Thus, the formation of cyclobutene $\mathbf{1}$ was first order dependant with ethynylbenzene and catalyst $\mathbf{Q}$ but did not change with the concentration of $\alpha$-methylstyrene concentration. These results suggested that the ligand exchange to form complex $\mathbf{8 3}$ was the rate-determining step of the transformation.

[^61]

Scheme 28. Gold species involved during the [2+2] cycloaddition.
In this context, we could observe a significant effect of the counterion in the preequilibrium between these gold species and therefore in the efficiency of the cyclobutene $\mathbf{1}$ synthesis. Thus, kinetic studies showed that the reaction rate as well as the final yield increased with more bulky and less basic counterions, such as $\mathrm{BAr}_{4}{ }_{4}{ }^{-}$. DFT calculations confirmed that large cations form more stable complexes with softer counterions.

## Chapter 5:

Towards the Total Synthesis of Rumphellaone $A$

## 1. Introduction

As explained in the General Introduction, the application of gold catalysis in the total synthesis of natural products with interesting biological properties has grown during the last decade together with the development of new catalysts and methodologies. ${ }^{1}$ Cycloisomerizations and cycloadditons attracted particular attention for the construction of polycyclic structures in an atom economy strategy and under mild conditions. As representative examples, (-)-englerin A, (-)-GSK1360707 and (+)-schisanwilsonene have been recently synthesized using gold catalysis in the key step of their total synthesis (Figure 1). In the first case, (-)-englerin A was isolated from Phylanthus engleri and showed selective inhibition of renal cancer cells growth. A gold-catalyzed [2+2+2] cyclization of an alkyne, an alkene and a ketone was used to build the main core of the natural product. ${ }^{2}$ (-)-GSK1360707 represents a particularly promising "triple-uptake inhibitor" of neurotransmitters related to symptoms of depression, since the more advanced medication strategy nowadays is to interfere them simultaneously. The construction of the fused cyclopropyl piperidine was achieved enantioselectively from a 1,6-enyne using a chiral phosphoramidite gold catalyst. ${ }^{3}$ Finally, ( + )-schisanwilsonene was isolated from Schisandra wilsoniana used in the treatment of hepatitis. The scaffold was formed via a gold-catalyzed tandem cyclization of a 1,6-enyne followed by an acetate 1,5-migration and an intermolecular cyclopropanation. ${ }^{4}$

(+)-Schisanwilsonene (Hepatitis)

Figure 1. Natural products synthesized via gold catalysis.
This time we focused our attention to the presence of a cyclobutane moiety in natural products, some of them with significant biological activity. The four-membered ring carbocycle can be found from pretty simple to more complex structures, for example, in $(-)$-biyouyanagin A, nervonin A and (+)-kelsoene (Figure 2). ${ }^{5}$

[^62]
(-)-Biyouyanagin A

Nervonin A

(+)-Kelsoene

Figure 2. Natural products containing a cyclobutane moiety.
However, the assembly of cyclobutanes and the related cyclobutenes is not synthetically straightforward. Traditionally, four-member rings have been obtained via [2+2] photocycloadditions of $\alpha, \beta$-unsaturated ketones or esters to alkenes, alkynes or allenes. ${ }^{6}$ This transformation usually proceeds by photochemical reactions challenging the stereochemical control. A few examples have been reported in the synthesis of cyclobutenes using metal-catalysis, for example, with palladium or platinum. ${ }^{7}$

Our interest was centred in the caryophyllene-related sesquiterpenes, specifically rumphellaone A (Figure 3). ${ }^{8}$ These natural products were isolated by the group of Sung in 2010 from the gorgonian coral Rumphella antipathies. ${ }^{9}$ Rumphellaone A showed cytotoxicity towards CCRF-CEM (human T-cell acute lymphoblastic leukemia) tumor cells ( $\mathrm{IC}_{50}=12.6 \mu \mathrm{~g} / \mathrm{mL}$ ).

Caryophyllene

Figure 3. Caryophyllene and related natural products.
So far, one total synthesis of rumphellaone A has been reported by Kuwahara in 2012 (Scheme 1). ${ }^{10}$ Their approach consisted in a stereospecific Stork epoxy nitrile cyclization. Hence, intermediate 7 was prepared from alcohol 1 by installing the nitrile group and performing a Horner-Wadsworth-Emmons reaction followed by an enantioselective Sharpless epoxidation. The Stork protocol employs a strong base to generate the delocalized anion that can undergo ring opening of the epoxide building simultaneously the three contiguous stereocenters of cyclobutane 9 . Subsequent carbon elongations led to

[^63]intermediate 15, which was hydrogenated followed by an acid-catalyzed lactonization to obtain the final product.

## Scheme 1. Total synthesis of Rumphellaone A.

This approach requires of sixteen steps ( $5 \%$ overall yield) involving several protectiondeprotection reactions. Therefore, we considered we could improve the synthetic route to rumphellaone A. Specifically, we reasoned that we could use an intermolecular goldcatalyzed $[2+2]$ cycloaddition of an alkyne and an alkene to build a cyclobutene moiety, which could be derivatized towards the main core of this natural product. Thus, reaction of ethynylbenzene and $\alpha$-methylstyrene with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right]^{2} \mathrm{SbF}_{6}$ (E) afforded cyclobutene 17 regioselectively via a distorted cyclopropyl gold carbene 18/18' (Scheme 2). ${ }^{11}$

[^64]

Scheme 2. Gold-catalyzed [2+2] cycloaddition of alkynes and alkenes.
Later, we also developed the gold-catalyzed [ $2+2+2$ ] cycloaddition between alkynes and oxoalkenes where a carbonyl group opened an analogous cyclopropyl ring via an intramolecular nucleophilic attack (see Chapter 2). ${ }^{12}$ Considering the result observed for 6 -methylhept-5-en-2-one when studying the effect of the substitution pattern in the alkene, we envisioned we could use this particular example for the total synthesis of rumphellaone A (Scheme 3). Hence, when the terminal carbon is the more substituted one, oxonium cation 23 would be formed by the nucleophilic attack of the ketone. However, cyclobutene product 19 was more favoured by ring expansion of the cyclopropyl gold(I) carbene intermediate 22 towards 21. Moreover, a detailed mechanistic study of this transformation was performed and allowed its improvement by tunning the counterion of the catalyst (see Chapter 3 and 4).

Scheme 3. Reaction of ethynylbenzene and 6-methylhept-5-en-2-one.

[^65]
## 2. Objectives

Therefore, we designed a novel route to the natural product comprising a gold-catalyzed [2+2] cycloaddition of a suitable alkyne 24 and 6 -methylhept-5-en-2-one to first form cyclobutene 25 followed by a diastereoselective hydrogenation to trans-26 and, finally, derivatization of the R-group to the appropriate lactone (Scheme 4).

Scheme 4. Synthetic route to rumphellaone $A$.

## 3. Silyloxyalkynylfuran Approach

## Retrosynthetic Analysis

First, we reasoned we could build a cyclobutene through a gold-catalyzed [2+2] cycloaddition between silyloxyalkynylfuran 27 and 6-methylhept-5-en-2-one (Scheme 5). The resulting intermediate 28 could undergo a vinylogous methylation and hydrogenation of $\mathbf{2 9}$ would lead to the natural product.

## Scheme 5. Retrosynthetic analysis of rumphellaone A.

Beforehand, several challenges of the route could be already conceived. To start, the diastereoselective hydrogenation of cyclobutene 29 would require the attack through the sterically more hindered face of the four-membered ring. The same would occur in the methylation step of 28. Nevertheless, similar transformations have been reported with additions to aldehydes, $\alpha, \beta$-unsaturated ketones, allylacetates, hydroxylamines or acetals in the presence of an organocatalyst, a Lewis acid or a fluoride source. ${ }^{13}$ Finally, the goldcatalyzed [2+2] cycloaddition between silyloxyalkynylfuran 27 and 6-methylhept-5-en-2one would require an exquisite selectivity towards the cyclobutene.

30

31

33

34

Figure 4. Possible by-products of the gold-catalyzed [2+2] cycloaddition.

[^66]Thus, there is the possibility that oxabicycle 30, tetrahydrofuran 31, trimer 32 and phenols 33/34, among others, are also formed (Figure 4). ${ }^{12,14}$

## Synthesis of the Silyloxyalkynylfuran

We designed various pathways to synthesize the desired silyloxyalkynylfuran 27. We started using trimethylsilyloxyfuran and attempting a deprotonation followed by the trapping with an electrophile to form either the iodo- or the aldehyde derivative 35 (Scheme 6). ${ }^{15}$

## Scheme 6. Reaction of trimethylsilyloxyfuran with a base and an electrophile.

Attempts of deprotonation with ${ }^{n} \mathrm{BuLi}$, LiHMDS or KHMDS and trapping with $\mathrm{I}_{2}$, 1,2diiodoethane or DMF from $-78^{\circ} \mathrm{C}$ to $25^{\circ} \mathrm{C}$ in diethyl ether led only to decomposition of the starting furan. Similar results were observed when a proton sponge, to avoid protonation, or 18 -Crown ether, to stabilize the cation, were added. On the other hand, when $\mathrm{Et}_{3} \mathrm{~N}$ was used as a base, no reaction was observed. Decomposition was observed as well when $\mathrm{I}_{2}$ or NIS were used in the absence of a base. ${ }^{16}$ In the case of 1,2-diiodoethane, no reaction occurred.

Considering the instability of the silyloxy protecting group, ${ }^{17}$ we reasoned that we could perform the cleavage of the TMS group followed by trapping with DMF forming the aldehyde 36 in situ. ${ }^{18}$ The reaction was attempted in a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried DMF in the presence of a fluoride source at room temperature. In particular, we screened $\mathrm{KF}, \mathrm{CsF}$, $\mathrm{AgF}, \mathrm{ZnF}_{2}$ and $\mathrm{KF} / \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ but all the reactions led to the protonated lactone (Scheme 7).

## Scheme 7. Reaction of trimethylsilyloxyfuran with a fluorine source.

We continued with the synthesis of ethynylfuran, which could be further oxidized with LiHMDS/TBHP and enolized to build the desired silyloxyalkynylfuran. ${ }^{19}$ Treatment of 2acetylfuran with pyridine $/ \mathrm{PCl}_{3}$ at $110{ }^{\circ} \mathrm{C}$ under microwave irradiation to dehydrate the ketone led to complete polymerization after 30 seconds. ${ }^{20}$ Processing furan-2-carbaldehyde with the Bestman-Ohira reagent in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in methanol to undergo an

[^67]homologation reaction resulted in the hydrolysis of the starting material. ${ }^{21}$ Eventually, treatment of furan with ${ }^{n} \mathrm{BuLi}$ and $\mathrm{I}_{2}$ afforded iodofuran in $65 \%$ isolated yield but the subsequent Negishi coupling reaction with ethynylmagnesium chloride, $\mathrm{ZnBr}_{2}$ and $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4} \mathrm{Pd}$ led to decomposition. ${ }^{22,23}$

We later tried to oxidize 2-(diethoxymethyl)furan to further hydrolyze the acetal and build a terminal alkyne from the corresponding aldehyde. ${ }^{24}$ Treatment with ${ }^{n} \mathrm{BuLi}$ and a mixture of $\mathrm{BCl}_{3}$ and $\mathrm{B}(\mathrm{OMe})_{3}$ would presumably generate the boronate intermediate 37 that could be oxidized in one pot to the corresponding lactone 38. However, only traces of the desired product were observed (Scheme 8).

## Scheme 8. Oxidation of 2-(diethoxymethyl)furan.

Moreover, we examined the possibility of oxidizing furan-2-carboxylic acid to 5-hydroxyfuran- $2(5 \mathrm{H})$-one with air in the presence of rose Bengal with 450 nm light in $\mathrm{CHCl}_{3}$ (Scheme 9). ${ }^{25} \mathrm{We}$ reasoned it could further undergo alkynylation and relactonization to intermediate 39. ${ }^{26}$ However, furan-2-carboxylic acid was recovered unchanged.

Scheme 9. Oxidation of furan-2-carboxylic acid.
Finally, we decided to attempt the synthesis of silyloxyalkynylfuran 27 avoiding the involvement of the furan scaffold in the early steps. We reasoned that we could selectively obtain the monoalkyne from either maleic anhydride or dimethyl maleate using 1 equivalent of ethynylmagnesium bromide and quenching with diluted HCl . Then, this could be selectively reduced with $\mathrm{NaBH}_{4}$, cyclized and enolized to obtain the key furan. However, a very complex mixture was observed when the reactions were performed either at $0,-50$ or $-78^{\circ} \mathrm{C} .{ }^{27}$

The same outcome was obtained when the reaction was attempted in the presence of LiCl , TMEDA, bis(methoxymethyl)ether or bis(2-dimethylaminoethyl)ether to stabilize the

[^68]Grignard reagent as well as when it was performed by slow addition. ${ }^{28}$ Still, if ethynyltrimethylsilane with ${ }^{n} \mathrm{BuLi}$ was used at $-60^{\circ} \mathrm{C}$, the ring-opening product 40 was obtained in $40 \%$ isolated yield (Scheme 10).

Scheme 10. Monoalkynylation of maleic anhydride.
Alternatively, the same carboxylic acid 40 could be synthesized using 1,2bis(trimethylsilyl)ethyne and $\mathrm{AlCl}_{3}$ in $25 \%$ isolated yield. ${ }^{29,30}$

## 2-Ethynyl-5-methylfuran as Model Substrate

In order to move forward, we synthesized 2-ethynyl-5-methylfuran as a model substrate and checked its reactivity towards the gold-catalyzed [2+2] cycloaddition with 6-methylhept-5-en-2-one. In this case, Negishi coupling from the iodo- derivative also failed to build the furan/alkyne $\mathrm{C}-\mathrm{C}$ bond (Scheme 11). ${ }^{22}$

Scheme 11. Synthesis of 2-ethynyl-5-methylfuran via Negishi coupling.
Therefore, we build the protected alkyne 41 via Sonogashira reaction in $35 \%$ isolated yield over three steps (Scheme 12). ${ }^{31}$ Although the deprotection led to decomposition when KOH was used, the desired alkynylfuran could be obtained with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in methanol in $60 \%$ isolated yield. Unfortunately, the route was not productive when it was applied either to 2-methoxyfuran, 2-tert-butyldimethylsilyloxyfuran nor 2-triisopropylsilyloxyfuran. ${ }^{13 \mathrm{~g}}$

[^69]

## Scheme 12. Synthesis via Sonogashira coupling.

First, we performed the reaction between the alkynylfuran and $\alpha$-methystyrene using ${ }^{t} \mathrm{BuXPhosAuCl} / \mathrm{NaBAr}_{4}{ }_{4}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25{ }^{\circ} \mathrm{C}$ for 24 h (Scheme 13). The desired cyclobutene $\mathbf{4 2}$ was obtained in $64 \%$ isolated yield.

Scheme 13. [2+2] Cycloaddition using $\alpha$-methylstyrene.
Then, we started the optimization of the gold cycloaddition with 6-methylhept-5-en-2-one by screening several ligands and counterions in the metal centre and maintaining the rest of conditions as in the original protocol (Table 1). ${ }^{11}$

Traces of the cyclobutene 43 were observed when JohnPhosAuCl, ${ }^{\dagger} \mathrm{BuXPhosAuCl}$ or IPrAuCl (Figure 5) combined with $\mathrm{NaBAr}_{4}{ }_{4}$ were used as the catalytic system (entries 1,2 and 3). ${ }^{32}$ A complex mixture was obtained with $\mathrm{Ph}_{3} \mathrm{PAuCl}$ (entry 4) but no reaction was observed with AuCl , (THT) AuCl or the gold complex with 44 (entries 5, 6 and 7). Interestingly, complete conversion with traces of the desired product was obtained when complex with 44 was activated with $\mathrm{AgSbF}_{6}$ (entry 8). We also analyzed the reaction of ${ }^{t} \mathrm{BuXPhosAuCl}$ with $\mathrm{AgSbF}_{6}, \mathrm{AgBF}_{4}$ and $\mathrm{AgNTf}_{2}$, which led to very complex mixtures (entries 9,10 and 11) and $\mathrm{NaSbF}_{6}$ did not show any reactivity (entry 12).

IPr

44

Figure 5. Ligands screened for the [2+2] cycloaddition.
We then tuned the stoichiometry, the concentration, the temperature and the reaction time (Table 2). Very low yields were observed at high concentrations (entries 1 to 4). No reaction was observed either at -20 or $0^{\circ} \mathrm{C}$ (entries 5 and 6 ). However, a slight increment in the yield to 43 was observed by increasing the temperature and/or performing the reaction under more diluted conditions when using an excess of the oxoalkene (entries 7, 8 and 9). Further equivalents of the oxoalkene or decreasing the concentration did not improve the results (entries 10 to 13 ). The cycloaddition could be optimized to $31 \%$ isolated yield within 2 h reaction at $80^{\circ} \mathrm{C}$ (entry 16).

We also analysed the effect of the concentration, temperature and reaction time when using an NHC ligand on gold (Table 3). In this case, the optimum concentration was also 0.2 M (entry 1) but no further improvement was observed with the increment of the temperature (entries 4 and 5).

Thereby, the best result in the synthesis of cyclobutene 43 was obtained with ${ }^{t}$ BuXPhosAuCl and $\mathrm{NaBAr}_{4}^{\mathrm{F}}(5 \mathrm{~mol} \%)$ in DCE $(0.2 \mathrm{M})$ at $80{ }^{\circ} \mathrm{C}$ for 2 h between 2-ethynyl-5-methylfuran and 6-methylhept-5-en-2-one (Scheme 14).

Scheme 14. Gold-catalyzed [2+2] cycloaddition of 2-ethynyl-5-methylfuran and 6-methylhept-5-en-2-one.

## 4. Oxidation Approach

## Retrosynthetic Analysis

We considered an alternative approach based on the possibility of oxidizing an aromatic ring to a carboxylic acid. ${ }^{33} \mathrm{We}$ reasoned that we could perform the gold-catalyzed [2+2] cycloaddition between ethynylbenzene and 6-methylhept-5-en-2-one followed by a diastereoselective hydrogenation of the cyclobutene 19 to trans-45 (Scheme 15). Then, the phenyl moiety could be oxidized with $\mathrm{RuO}_{4}$. In this manner, the carboxylic acid trans-46 could undergo a methylation reaction and a subsequent stereoselective allylation of the resulting ketone to 47 .

Scheme 15. Alternative retrosynthetic analysis of Rumphellaone A.
The feasibility of building a lactone from an homoallylic alcohol (47) was also a critical transformation in the design of our new synthetic route. ${ }^{34}$ Hence, we planned a reverse Wacker oxidation to afford hemiacetal 48 followed by silver oxidation to form the lactone moiety present in rumphellaone A (Scheme 16).

## Scheme 16. Planned reverse Wacker oxidation.

Besides, we had to consider performing a gold-catalyzed [2+2] cycloaddition enantioselectively. Although several asymmetric gold catalysts have been developed recently using chiral ligands and/or counterions, these have been limited mainly to

[^71]intramolecular reactions. Otherwise, most of the gold-catalyzed transformations are stereospecific and enantioenriched products have been obtained via substrate-induced enantioselective reactions. ${ }^{35}$

## Use of a Chiral Acetal

Since substrate-induced enantioselectivity has proved to be much more effective in gold catalysis, we reasoned we could attempt the $[2+2]$ cycloaddition introducing a chiral element either in the oxoalkene or the alkyne. We considered that the more promising approach was to use an asymmetric protecting group in the ketone moiety like in 49 to build enantioenrich cyclobutene 50 (Scheme 17). Therefore, we seek for diols bulky enough to form an acetal that could influence the stereoselectivity occurring in the alkene group.

## Scheme 17. Substrate-controlled enantioselective [2+2] gold cycloaddition.

First, we imagined an acetal derived from BINOL derivatives such as 51, 52, 53 and $\mathbf{5 4}$ (Figure 6).

Figure 6. BINOL derivatives as protecting groups.
We calculated the optimized structures of the corresponding acetals with 6-methylhept-5-en-2-one using DFT analysis (M06, 6-31 $\mathrm{G}(\mathrm{d})(\mathrm{C}, \mathrm{H}, \mathrm{O})$, in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). In the case of the antracene-substituted BINOL 51, we could observe a distance between the chiral unit and the alkene of $3.48 \AA$ in the external position and $3.94 \AA$ for the internal one after the acetal formation (Figure 7).

[^72]

Figure 7. Chiral acetal with 51.
In the presence of triphenylsilyl groups (52) the distances were $3.37 \AA$ and $3.81 \AA$, which are reasonably similar (Figure 8). Conversely, for the trifluoromethyl groups (54), $3.95 \AA$ and $3.75 \AA$ so in this case the internal position would be more crowded.

Figure 8. Chiral acetals with 52 and 54.
Finally, in the case of isopropyl groups (53), the distances were $2.70 \AA$ and $2.75 \AA$. Both carbons are quite comparable and notably shorter than the rest of protecting groups (Figure 9).

Figure 9. Chiral acetal with 53.

We first synthesized acetal 55 using butane-1,4-diol. Reaction with $p$-toluensulfonic acid in toluene under reflux led to decomposition of 6-methylhept-5-en-2-one. ${ }^{36}$ Similar results were obtained with propane-1,3-diol or ethane-1,2-diol. However, acetal 55 was obtained in $65 \%$ isolated yield when treated with $\mathrm{NH}_{4} \mathrm{Cl}$ and hydroquinone in a Dean-Stark apparatus. Purification difficulties forced us to attempt the reaction employing a Lewis acid and triethyl orthoformate (Table 4). ${ }^{37}$ Then, acetal 55 was easily purified by distillation. $\mathrm{CeCl}_{3}$ and $\mathrm{AuBr}_{3}$ forged product 55 in modest yields (entries 1 and 2) whereas $\mathrm{ZrCl}_{4}$ only afforded traces of it (entry 3). The best results were obtained using $\mathrm{FeCl}_{3}$ (entry $4)$. No reaction was observed with $\mathrm{CuSO}_{4}$ (entry 6).

## Table 4. Screening of Lewis acids for an alternative synthesis of 55 .

| Entry | Lewis acid | Outcome $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: |

| internal standard, yields referred to acetal |  |  |
| 55. ${ }^{\text {I }}$ Isolated yield. |  |  |

We performed the gold-catalyzed $[2+2]$ cycloaddition between ethynylbenzene and acetal 55 to construct cyclobutene 56 (Table 5). Keeping ${ }^{t}$ BuXPhos as the ligand for gold and DCE as solvent, we screened the reaction conditions. Interestingly, the cationic catalyst was required in this case as the generation in situ of the active species with the corresponding gold chloride and $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}$ was partially cleaving the acetal in $\mathbf{5 5}$ and $\mathbf{5 6}$.

Very low yields to the desired product were observed when the reaction was performed at $50{ }^{\circ} \mathrm{C}$ (entries 1 to 4 ). Gradual increment of the stoichiometry at $25^{\circ} \mathrm{C}$ showed higher yields with an excess of the alkyne and $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$as the counterion (entries 5 to 8). Parallel experiments at $0{ }^{\circ} \mathrm{C}$ led to lower yields and conversions (entries 9, 10 and 11). However, longer reaction times with larger amounts of ethynylbenzene slowly improved the result (entries 12, 13 and 14).

| 15 | $\mathrm{BAr}_{\mathrm{F}}{ }^{-}$ | 2.0 | 0 | 48 | 42\% (74\%) |
| 16 | $\mathrm{BAr}_{\mathrm{F}}{ }^{-}$ | 5.0 | 0 | 48 | 45\% (86\%) |
| 17 | $\mathrm{BAr}_{\mathrm{F}}{ }^{-}$ | 10 | 0 | 48 | 50\% ${ }^{\text {c }}$ (89\%) |
| 18 | $\mathrm{BAr}_{\mathrm{F}}{ }^{-}$ | 10 | -20 | 20 | 21\% (41\%) |

Therefore, the most efficient result was obtained when 10 equiv. of ethynylbenzene and $\left[{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4}(\mathbf{Q})$ were added at $0{ }^{\circ} \mathrm{C}$ for 48 h in which cyclobutene $\mathbf{5 6}$ was obtained in $50 \%$ isolated yield (Scheme 18). Further decrease of the temperature to $-20^{\circ} \mathrm{C}$ did not improve the result (entry 18).

Scheme 18. Gold-catalyzed [2+2] cycloaddition of ethynylbenzene and acetal 55.
We attempted the formation of a chiral acetal such as 57 from 6-methylhept-5-en-2-one and BINOL to build the corresponding cyclobutene 58 with ethynylbenzene and [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{BAr}^{\mathrm{F}}{ }_{4}(\mathbf{Q})$ under the optimized conditions (Scheme 19).

Scheme 19. Synthesis of acetal 57 and substrate - controlled
enantioselective $[2+2]$ cycloaddition.
Nevertheless, acetal 57 could not be prepared using the methodologies applied for the standard acetal 55. Other Lewis acids such as $\mathrm{InCl}_{3}$ or $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ were also tested but unreacted BINOL was recovered. ${ }^{38}$ Finally, the reaction was attempted with $\mathrm{P}_{2} \mathrm{O}_{5}$ in toluene at $75^{\circ} \mathrm{C}$ but complete decoposition of the oxoalkene was obtained. ${ }^{39}$

Due to the failure in forming a chiral acetal, a substrate - controlled gold-catalyzed asymmetric [2+2] cycloaddition to build an enantioenrich cyclobutene was dismissed.

## Enantioselective Gold-Catalyzed [2+2] Cycloaddition

Consequently, we essayed several chiral gold complexes in the [2+2] cycloaddition of ethynylbenzene and 6-methylhept-5-en-2-one. We started by testing complex $\mathbf{V}$ and tuning the counterion, the stoichiometry and the temperature of the reaction (Scheme 20). ${ }^{40}$

Scheme 20. [2+2] Cycloaddition using V.
A complex mixture was obtained at $50{ }^{\circ} \mathrm{C}$ with 4 equiv. of ethynylbenzene either using $\mathrm{SbF}_{6}{ }^{-}$or $\mathrm{BAr}^{\mathrm{F}} 4^{-}$. The same outcome was observed at lower temperature $\left(25^{\circ} \mathrm{C}\right)$ or when switching the stoichiometry. With the protected oxoalkene 55, we obtained the same result altough at $0^{\circ} \mathrm{C}$ only cleavage of the acetal was observed.

We attempted the reaction with another ferrocene-based gold catalyst $(\mathbf{W})$ with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$and at $25{ }^{\circ} \mathrm{C}$ (Scheme 21). ${ }^{41}$ Under these conditions we observed the formation of enantioenriched cyclobutene 19 in $13 \%$ yield ( $57 \%$ conversion) and $33 \%$ ee. This result is

[^74]still rather poor but it is one of the few examples of inducing enantioselectivity in an intermolecular cycloaddition to an alkyne.

Scheme 21. [2+2] Cycloaddition using $W$.
Performing the reaction in the same conditions using complex $\mathbf{X}$ led to no reaction, even when heating at $50{ }^{\circ} \mathrm{C}$ (Figure 10). ${ }^{42} \mathrm{As}$ observed before, $\mathrm{NaBAr}_{4}{ }_{4}$ is not always productive in the chloride abstraction of a phosphite gold complex.

Figure 10. Complex X.
Simultaneously, it was determined by NMR experiments that triflimide could be a useful counterion for gold cycloadditions at low temperatures. ${ }^{43}$ Thus, ligand exchange with ethynylbenzene was observed from $-78{ }^{\circ} \mathrm{C}$ to $20^{\circ} \mathrm{C}$ when the corresponding digold scaffold started to abound significantly. Therefore, multiple attempts were essayed using $\mathrm{AgNTf}_{2}$ as the halide scavenger (Scheme 22).

Scheme 22. Screening of ligands with NTf $_{2}$.
This time we focused in bidentate phosphines and a phosphoramidite as they have been more commonly and successfully used in enantioselective gold catalysis. ${ }^{44}$ We started our screening using gold complexes $\mathbf{Y}, \mathbf{Z}, \mathbf{L L}$ and $\mathbf{S S}$ (Figure 11).

[^75]

Figure 11. Other chiral gold complexes.
No cyclobutene 19 was observed when the reactions were performed at 0,25 or $50{ }^{\circ} \mathrm{C}$ using 1:4 or 4:1stoichiometries. Interestingly, we detected the formation of a new product that we identified as tetrahydropyran $\mathbf{5 9}$, analogous to the tetrahydrofurans isolated during the formation of oxabicycles (see Chapter 2). ${ }^{12}$ Thus, byproduct 59 was obtained in $38 \%$ isolated yield when the cycloaddition of ethynylbenzene and an excess of 6-methylhept-5-en-2-one was performed with complex $\mathbf{Z}$ and triflimide at $25^{\circ} \mathrm{C}$ (Scheme 23).

Scheme 23. Formation of by-product 59.
Therefore, we decided to continue the screening for the formation of the enantioenriched cyclobutene 19 using $\mathrm{BAr}^{\mathrm{F}}{ }_{4}$ as the counterion (Table 6). ${ }^{32}$

## Table 6. Screening of ligands with BAr $_{F}{ }^{-}$.

| Entry | $[\mathbf{A u}]$ | X equiv. | Temperature <br> $\left({ }^{\circ} \mathbf{C}\right)$ | Outcome $^{\boldsymbol{a}, \boldsymbol{b}}$ | $\boldsymbol{e e}^{\boldsymbol{c}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $\mathbf{Y}$ | 4 | 50 | $61 \%{ }^{\boldsymbol{c}}(69 \%)$ | $30 \%$ |
| 2 | $\mathbf{Z}$ | 4 | 50 | No reaction | Not determined |
| 3 | $\mathbf{L L}$ | 4 | 50 | $6 \%(74 \%)$ | Not determined |
| 4 | $\mathbf{S S}$ | 4 | 50 | $7 \%(68 \%)$ | Not determined |
| 5 | $\mathbf{L L}$ | 4 | 25 | Complex mixture | Not determined |
| 6 | $\mathbf{S S}$ | 4 | 25 | Complex mixture | Not determined |
| 7 | $\mathbf{S S}$ | 4 | 0 | No reaction | Not determined |
| 8 | $\mathbf{L L}$ | 0.25 | 25 | No reaction | Not determined |
| 9 | $\mathbf{L L}$ | 0.25 | 0 | No reaction | Not determined |

[^76]We could observe the clean formation of the desired product $\mathbf{1 9}$ when complex $\mathbf{Y}$ was used at $50^{\circ} \mathrm{C}$ (entry 1 ). No product was observed for $\mathbf{Z}$ (entry 2 ) and only traces for $\mathbf{L L}$ and $\mathbf{S S}$. No improvements were observed for $\mathbf{Z}, \mathbf{L} \mathbf{L}$ or $\mathbf{S S}$ at lower temperatures or when switching the stoichiometry (entries 7 to 11).

Chiral HPLC determined that the cyclobutene 19 obtained with catalyst $\mathbf{Y}$ had $30 \%$ ee at $50^{\circ} \mathrm{C}$ (Scheme 24).

Scheme 24. Enantioselective [2+2] cycloaddition.
With these results result, we envisioned the study related BIPHEP bis-phosphine scaffolds tuning the backbond of the complex as well as the substituents of the phosphine: Y2, Y3, Y4 and Y5 (Figure 12).

Figure 12. BIPHEP gold complexes related to $Y$.
Simultaneously, the effect of the reaction conditions is also on-going work. ${ }^{45}$ Although the results are still modest, we proved that an intermolecular, enantioselective [2+2] cycloaddition between an alkyne and an alkene is certainly feasible.

## Synthesis of the Racemic Rumphellaone A

Concurrently, we continued towards the total synthesis of rumphellaone A working on the racemic version.

## - Gold-Catalyzed [2+2] Cycloaddition

As mentioned before, cyclobutene 19 could be obtained in $54 \%$ isolated yield using 6-methylhept-5-en-2-one and 3.5 equiv. of ethynylbenzene with $5 \mathrm{~mol} \%$ of [ ${ }^{t}$ BuXPhosAuNCMe] $\operatorname{SbF}_{6}(\mathbf{E})$ in $\operatorname{DCE}(0.5 \mathrm{M})$ at $50{ }^{\circ} \mathrm{C}$ for 19 h (Scheme 3). ${ }^{12}$ The

[^77]reaction yield could be improved to $78 \%$ when [ ${ }^{t}$ BuXPhosAuNCMe] $\mathrm{BAr}^{\mathrm{F}}{ }_{4}(\mathbf{Q})$ was used (Scheme 25). ${ }^{32}$ In this case, just $18 \%$ of the corresponding oxabicycle (20) was observed.

Scheme 25. Optimized synthesis of cyclobutene 19.
In order to explore the effect of the aromatic ring's substituents in the oxidation to carboxylic acid 46, we also synthesized cyclobutenes $\mathbf{6 0}, 61$ and 62 using 3-ethynylphenol, 1-ethynyl-3-methoxybenzene and 1-ethynyl-3-methylbenzene under the optimized conditions in 40,65 and $44 \%$ isolated yields, respectively (Figure 13). Although the yields were lower than with ethynylbenzene, they could be useful substrates in the oxidation step.

Figure 13. Alternative precursors of rumphellaone A.

## - Hydrogenation of the Cyclobutene.

First, we reduced the alkene moiety of 19 using $10 \mathrm{~mol} \% \mathrm{Pd} / \mathrm{C}$ in methanol at $25{ }^{\circ} \mathrm{C}$ stirring for 5 h under 1 atm of $\mathrm{H}_{2}$ to obtain the cyclobutane moiety (45) in $90 \%$ isolated yield (Scheme 26). ${ }^{46}$ However, this conditions led to a $1.6: 1$ mixture of diastereoisomers.

Scheme 26. Hydrogenation of 19 with Pd/C and $H_{2}$.
As suspected, the steric factors were not significant enough to undergo a diastereoselective hydrogenation. Hence, we reasoned we could use the carbonyl moiety as a directing group. We attempted the hydrogenation using Crabtree's catalyst, $\left[\operatorname{Ir}(\operatorname{cod}) \mathrm{PCy}_{3}(\mathrm{py})\right] \mathrm{PF}_{6}$, in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 27). ${ }^{47,48}$ Although there are examples of free alcohols, ketones, ethers and

[^78]esters behaving as directing groups up to four carbons distance by coordination to the metal, which slightly resembles our case, no reaction was observed.

Scheme 27. Directing effect using Crabtree's catalyst.
The most promising alternatives relied on radical-based protocols as the thermodynamic product would be formed. However, these methodologies are rarely applied in styrenes. Very recently, a new procedure to reduce inactivated alkenes with thermodynamic stereocontrol was reported using a manganese complex with phenylsilane and TBHP in isopropanol. ${ }^{49}$ Presumably, a metal-hydride is formed and undergoes a hydrogen atom transfer reaction to the alkene. Therefore, a carbon centred radical is formed and builds the more stable product when is finally reduced. We tested this reaction with cyclobutene $\mathbf{1 9}$ but only polymerization was observed (Scheme 28). Further attempts based on decreasing the concentration, increment of the equivalents of the silane or TBHP (decane) or use of THF as co-solvent led to the same result.

Scheme 28. Alkene reduction with thermodynamic stereocontrol.
Later, we applied the Birch reduction conditions as there are a few examples reported on the selective reduction of styrene's double bond. ${ }^{50,51}$ After screening, the best results were obtained when cyclobutene 64, synthesized analogously to 56 but with the six-membered ring acetal 63, was treated with sodium metal in liquid ammonia at $-78^{\circ} \mathrm{C}$ for 30 min to obtain cyclobutane $\mathbf{6 5}$ in $40 \%$ yield with a 1:5 diastereoselectivity (Scheme 29). In spite of the improvement, the yield was still low.

[^79]

## Scheme 29. Birch reduction of styrenes.

An alternative protocol consisted in adding magnesium turnings to cyclobutene $\mathbf{1 9}$ in methanol (Scheme 30). ${ }^{52}$ However, no 45 was obtained as the double bond was recovered intact but partial reduction of the ketone to the secondary alcohol was observed.

## Scheme 30. Reduction with $\mathrm{Mg} / \mathrm{MeOH}$.

On the other hand, when potassium metal in dimethylamine was used, no reaction was occurred (Scheme 31).

Scheme 31. Reduction with $\mathrm{K} / \mathrm{Me}_{2} \mathrm{NH}$.
Finally, reaction with $\mathrm{Li} /$ naphthalene in the presence of $\mathrm{NiCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ in THF at $25^{\circ} \mathrm{C}$ did not lead to the desired product (Scheme 32). ${ }^{53}$ Using DTBB as initiator led to no reaction as well as anhydrous $\mathrm{NiCl}_{2}$ under $\mathrm{H}_{2}$ atmosphere.

Scheme 32. Reduction with Li/naphthalene and $\mathrm{NiCl}_{2} \cdot \mathbf{6 H} \mathrm{H}_{2} \mathrm{O}$.

[^80]Regarding the challenge of the stereoselectivity, we reasoned that we could attempt the isomerization towards the trans-cyclobutane in a late stage of the total synthesis. After the oxidation of the phenyl ring and esterification, we could use a base to deprotonate the $\alpha$ position of the ester 66. The desired diastereoisomer would be obtained under thermodynamic conditions (Scheme 33).

Scheme 33. Possible late stage isomerization.
Furthermore, we optimized both the cis- and the trans-cyclobutane by means of DFT calculations ( $\mathrm{M} 06,6-31 \mathrm{G}(\mathrm{d})(\mathrm{C}, \mathrm{H}, \mathrm{O})$, in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. Our calculations indicated that trans66 is $2.8 \mathrm{kcal} / \mathrm{mol}$ more stable than cis-66 (Figure 14).

$0.0 \mathrm{kcal} / \mathrm{mol}$

$2.8 \mathrm{kcal} / \mathrm{mol}$

Figure 14. Diastereoisomers of ester 66.
We also submitted cyclobutenes $\mathbf{6 0}, 61$ and $\mathbf{6 2}$ to the hydrogenation conditions with catalytic Pd/C in methanol (Figure 15). Cyclobutanes 67, 68 and 69 were obtained in 86, 53 and $84 \%$ respectively.

## - Phenyl Oxidation Followed by Esterification

Acconding to the literature, the oxidation of aryl rings is commonly carried out using catalytic $\mathrm{RuCl}_{3}$ with an excess of $\mathrm{NaIO}_{4} \cdot{ }^{54,55}$ The transformation to carboxylic acids proceeds through the generation of $\mathrm{RuO}_{4}$ in situ, which oxidizes any unsaturated $\mathrm{C}-\mathrm{C}$ bond. We first performed the reaction with cyclobutane 45 using $3 \mathrm{~mol} \%$ catalyst testing different solvent mixtures (Table 7). Only traces of the carboxylic acid 46 were observed when 15 equiv. of $\mathrm{NaIO}_{4}$ were used in a mixture of $\mathrm{CCl}_{4}: \mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O}(2: 2: 3)$ for 4 h (entry 2). No reaction was observed with $\mathrm{H}_{5} \mathrm{IO}_{6}$ (entry 3) and very low reactivity was also obtained if $\mathrm{NaIO}_{4}$ was combined with $\mathrm{NaHCO}_{3}$ (entry 4).

Table 7. Screening for the phenyl oxidation using $\mathrm{RuCl}_{3} / \mathrm{NaIO}_{4}$.

|  |  | $\text { Me } \xrightarrow[\substack{\text { Solvents }(0.1 \mathrm{M}), \\ \text { rt, time }}]{\begin{array}{c} 3 \mathrm{~mol} \% \mathrm{RuCl}_{3} \\ \text { X equiv. } \mathrm{NaO}_{4} \end{array}}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Entry | X equiv. | Solvents | Reaction time (h) | Outcome ${ }^{\text {a }}$ |
| 1 | 5 | $\begin{gathered} \mathrm{CCl}_{4}: \mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O} \\ (2: 2: 3) \end{gathered}$ | 4 | No reaction |

| $4^{c}$ | 5 | $\begin{gathered} \text { EtOAc: } \mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O} \\ (1: 1: 8) \\ \hline \end{gathered}$ | 144 | Traces |

${ }^{a}$ Crude analysed by ${ }^{1} \mathrm{H}$ NMR using 1,4-diacetylbenzene as internal standard, yields referred to carboxylic acid 46. ${ }^{b} \mathrm{H}_{5} \mathrm{IO}_{6}$ used as the oxidant. ${ }^{c} 1.2$ equiv. of $\mathrm{NaHCO}_{3}$ added.

On the other hand, we changed the protocol to $10 \mathrm{~mol} \% \mathrm{RuO}_{2}$ with an excess of $\mathrm{NaIO}_{4}$ in EtOAc: $\mathrm{H}_{2} \mathrm{O}$ (1:3) under highly diluted conditions. ${ }^{56}$ The transformation was performed from 4 to $25^{\circ} \mathrm{C}$ for 24 h to afford the carboxylic acid 46 in $80 \%$ isolated yield (Scheme 34).

Scheme 34. Phenyl oxidation using $\mathrm{RuO}_{2} / \mathrm{NaIO}_{4}$.
Moreover, carboxylic acid 46 could be obtained from cyclobutane 67 in $83 \%$ isolated yield, 68 in $90 \%$ and 69 in $92 \%$.

[^81]Afterwards, the esterification of $\mathbf{4 6}$ with TMS-diazomethane in a mixture of toluene and methanol at $0{ }^{\circ} \mathrm{C}$ afforded the methyl ester 66 in $91 \%$ isolated yield (Scheme 35). ${ }^{57}$

Scheme 35. Esterification of carboxylic acid 46.

## - Protection via Acetalization

We first attempted the protection of the ketone functionality in 66 with propane-1,3-diol under the optimized conditions used to synthesize acetal 55. ${ }^{37 \mathrm{~b}}$ We submitted the substrates to catalytic $\mathrm{FeCl}_{3}$ and an excess of triethyl orthoformate in order to form a six-membered ring as in acetal 70 (Scheme 36).

Scheme 36. Acetalization of ester 66.
Surprisingly, no reaction was observed under these circumstances. We performed the acetalization of ester 66 using 2 equiv. of TMS-protected ethylene glycol and catalytic TMSOTf in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$ (Scheme 37). ${ }^{58}$ In this manner, acetal 71 was obtained quantitavely. Due to decomposition on silica gel, we optimized the purification by quenching the crude reaction mixture with pyridine and washing sequentially with saturated $\mathrm{NaHCO}_{3}, \mathrm{CuSO}_{4} 1 \%$ and water. ${ }^{59}$ However, when the reaction was tested at larger scale, removal of the unreacted TMS-protected ethylene glycol was difficult. Consequently, cleavage of the silyl groups with TBAF was necessary, which was slightly detrimental for the final yield

Scheme 37. Alternative acetalization of ester 66.

[^82]
## - Isomerization to the Thermodynamic Cyclobutane

We started testing the isomerization using ester 66 with 1 equivalent of sodium methoxide in a mixture of THF:methanol (1:1) at $45{ }^{\circ} \mathrm{C}$ for 48 h , which led to a complex mixture (Scheme 38). ${ }^{56}$

Scheme 38. Isomerization of ester 66.
On the other hand, applying the same conditions on protected ester $\mathbf{7 1}$ led to isomerization when modifying gradually the temperature and the reaction time (Table 8).

Table 8. Screening of the temperature and the reaction time for the isomerization of the protected ester 71.

| Entry | Experiment | Temperature <br> $\left({ }^{\circ} \mathbf{C}\right)$ | Reaction <br> time (h) | Ratio $^{\boldsymbol{a}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 45 | 1 | $53: 47$ |
| 2 | 1 | 45 | 12 | $61: 39$ |
| 3 | 1 | 25 | 8 | $61: 39$ |
| 4 | 1 | 65 | 1 | $63: 37$ |
| 5 | 1 | 65 | 12 | $77: 23$ |
| 6 | 2 | 70 | 2 | $63: 37$ |
| 7 | 2 | 70 | 12 | $91: 9$ |
| 8 | 3 | 70 | 20 | $97: 3$ |

${ }^{a}$ Reaction monitored by GC-MS.
Almost no change was observed after 1 h at $45^{\circ} \mathrm{C}$ but it varied to $61: 39$ after 12 h (entries 1 and 2). Interestingly, if the reaction mixture was stirred for 8 h more at $25^{\circ} \mathrm{C}$, this result was maintained (entry 3). When the temperature was further increased to $65^{\circ} \mathrm{C}$, the ratio was $63: 37$ after 1 h and 77:23 after 12 h (entries 4 and 5). On the other hand, if the reaction was settled at $70^{\circ} \mathrm{C}$, we could observe a mixture $63: 37$ after $2 \mathrm{~h}, 91: 9$ after 12 h and 97:3 after 20 h (entries 6, 7 and 8). Quenching with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ at $0{ }^{\circ} \mathrm{C}$ followed with extraction with ethyl acetate afforded the pure product in $77 \%$ isolated yield. NOESY experiments confirmed that the isomer obtained is the protected ester trans-71 (Figure 16: protons of the cyclobutane junction labeled with a circle and a star).

Figure 16. NOESY experiment of trans-71.
Thus, no interaction was observed between the hydrogens in the cyclobutane ring. Otherwise, when we analyzed the $1: 1$ cis:trans mixture of the protected ester 71, we could identify cis-71 with the cross-peak between the hydrogens in the cyclobutane ring (Figure 17: protons of the cyclobutane junction labeled with a triangle and a square).

Figure 17. NOESY experiment of both diastereoisomers of 71.

## - Weinreb Amide and Methylation.

In order to form the methyl ketone from ester trans-71, we decided to generate the corresponding Weinreb amide, which could later undergo nucleophilic attack with methyl magnesium bromide. Thus, we treated it with $\mathrm{N}, \mathrm{O}$-dimethylhydroxylamine hydrochloride and isopropyl magnesium chloride in THF at $0^{\circ} \mathrm{C}$ (Scheme 39). ${ }^{60}$

[^83]

Scheme 39. Formation of the Weinreb amide trans-72.
The desired product trans-72 was obtained in $81 \%$ yield as a single diastereoisomer. The methylation reaction was performed immediately with no further putification. Specifically, the Weinreb amide was dissolved in THF and treated with methyl magnesium bromide from $0^{\circ} \mathrm{C}$ to $25^{\circ} \mathrm{C}$ for 1.5 h to give methyl ketone trans- 73 as a single diastereoisomer in $65 \%$ isolated yield (Scheme 40). ${ }^{61}$

Scheme 40. Methylation of the Weinreb amide trans-73.

[^84]
## 5. Outline

## Final Steps Towards Rumphellaone $\mathbf{A}^{62}$

- Stereoselective Allylation Reaction

First, we considered the possibility to perform a diastereoselective allylation of trans-73. ${ }^{63}$ As an example, an allyl boronate could undergo transmetallation to finally promote a nucleophilic attack to the ketone moiety via a Zimmerman-Traxler transition state (74) and build trans-75 (Scheme 41). ${ }^{64}$

Scheme 41. Diastereoselective allylation of trans-73.
Due to the small steric difference between both faces of the cyclobutane, we also analyzed the feasibility of using a chiral reagent to perform the stereoselcetive allylation. However, we should take into consideration a match-mismatch situation with the asymmetric substrate during the process.

Although many efforts have been centered in developing enantioselective methodologies to add an allyl group to a wide variety of aldehydes, the examples on ketones are still rare. Several protocols using zinc, silver, iridium, nickel and titanium have been reported. ${ }^{65,66,67}$

[^85]Therefore, for the completion of the total synthesis, we planned to perform an enantioselective allylation of trans-73 to trans-75 by treating the methyl ketone with an allyl boronate and a metal in the presence of a chiral ligand (Scheme 42). ${ }^{68}$

Scheme 42. Enantioselective allylation of trans-73.
Alternatively, a stereoselective reduction of the methyl ketone trans-73 could be performed with a chiral aluminium or borohydride to obtain a secondary alcohol. ${ }^{69} \mathrm{~A}$ ruthenium or rhodium catalyzed hydrogenation could be performed as well. ${ }^{70}$ This could be transformed to the enantioenrich tertiary alcohol trans-75 via a stereospecific lithiation/borylation reaction followed by hydrolysis . ${ }^{71}$

It is important to note that, until the first gold-catalyzed [2+2] cycloaddition is not enantioselective, ${ }^{72}$ two different diastereoisomers will be obtained at this point. Thus, the enantiomer $(\boldsymbol{S}, \boldsymbol{R})$ - $\mathbf{- 7 3}$ would lead to $(\boldsymbol{S}, \boldsymbol{S}, \boldsymbol{R}) \mathbf{- 7 5}$ but the $(\boldsymbol{R}, \boldsymbol{S})$ - $\mathbf{7 3}$ to $(\boldsymbol{S}, \boldsymbol{R}, \boldsymbol{S}$, )-75 (Figure 18).

Figure 18. Diastereoisomers of alcohol 75.

[^86]Towards the Total Synthesis of Rumphellaone A

## - Reverse Wacker Oxidation

Finally, as mentioned in Scheme 16, a reverse Wacker oxidation has been reported for homoallylic alcohols to generate an acetal that is further oxidized to a lactone. Thus, alcohol trans- 75 could cyclize to acetal 48 using catalytic $\mathrm{Pd}\left(\mathrm{NO}_{2}\right) \mathrm{Cl}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2}$ and $\mathrm{CuCl}_{2}$ in tert-butanol and then treated with trifluoroacetic acid (Scheme 45). ${ }^{73}$ It is expected that this could also cleave the five-membered ring acetal used to protect the ketone. Without further purification, acetal $\mathbf{4 8}$ could be oxidized to a lactone with $\mathrm{Ag}_{2} \mathrm{CO}_{3}$-Celite in toluene under reflux. These conditions would afford at last rumphellaone A.

Scheme 45. Reverse Wacker oxidation to afford rumphellaone $\boldsymbol{A}$.

[^87]
## 6. Conclusions

Based on the results obtained in Chapters 2, 3 and 4 about the possible formation of a cyclobutene scaffold in a gold-catalyzed intermolecular [2+2] cycloaddition between an alkyne and an oxoalkene, we envisioned its application to the total synthesis of rumphellaone A. Our first approach consisted in using a silyloxyalkynylfuran, which led to the key cyclobutene 43 in only $31 \%$ isolated yield (Scheme 14).

Scheme 14. Gold-catalyzed [2+2] cycloaddition of 2-ethynyl-5-methylfuran and 6-methylhept-5-en-2-one.

Therefore, we changed the strategy based on the oxidation of a phenyl ring to a carboxylic acid (Scheme 46).

Scheme 56. Towards Rumphellaone $A$.
Thus, we performed the gold-catalyzed [2+2] cycloaddition of ethynylbenzene and 6-methylhept-5-en-2-one using complex $\mathbf{Q}$ ( $78 \%$ yield) followed by a non-diastereoselective hydrogenation of cyclobutene 19 with $\mathrm{Pd} / \mathrm{C}$ in $90 \%$ yield. Oxidation afforded the carboxylic acid 46 in $80 \%$ isolated yield. Further esterification (66, 90\%) and protection of the ketone (71, quantitative) allowed a late stage isomerization towards trans-71 in 77\% yield (97:3). Generation of the Weinreb amide (trans-72) followed by methylation afforded our last intermediate trans-73. A consequent stereoselective allylation to trans-75 followed by an oxidative cyclization are suggested to finally synthesize rumphellaone A .

A current challenge is still the enantioselective gold-catalyzed [2+2] cycloaddition of alkynes with alkenes. Although several asymmetric gold catalysts have been recently developed, their application has been mainly limited to intramolecular transformations. In our case, we first designed a substrate-induced enantioselective reaction via an asymmetric acetal since the transfer of chirality has proven to be much more effective in these reactions (Scheme 18).

Scheme 18. Gold-catalyzed [2+2] cycloaddition of ethynylbenzene and acetal 55.

Acetal 55 could form the corresponding cyclobutene 56 in $50 \%$ isolated yield. However, the BINOL analogous could not be formed. Thus, preliminar screenings of chiral gold complexes have been performed.

For the moment, cyclobutene 19 has been obtained in $61 \%$ isolated yield ( $67 \%$ conversion) with $30 \%$ ee using catalyst $\mathbf{Y}$ and 1 equiv. of $\mathrm{NaBAr}_{4}{ }_{4}$ in the optimized conditions (Scheme 47). This result proves that the enantioselective [2+2] cycloaddition and its application to the total synthesis of rumphellaone A are possible and encourage us to continue this work.

Scheme 47. Enantioselective [2+2] cycloaddition.
Although two steps are still remaining in order to accomplish the synthesis of this natural product, we have designed a straightforward synthetic route towards rumphellaone A and proved its feasibility by reaching a late-satge intermediate stereoselectively and in excellent yields.

General Conclusions

As explained in the General Introduction, gold-catalyzed transformations via the activation of unsaturated moieties towards nucleophilic attack emerged as a powerful tool for the construction of $\mathrm{C}-\mathrm{C}, \mathrm{C}-\mathrm{O}$ and $\mathrm{C}-\mathrm{N}$ bonds due to the remarkable carbophilic properties of this metal. ${ }^{1,2}$ Thus, gold complexes allowed the construction of complex architectures under mild conditions from readily assembled starting materials. The understanding and combination of these new reactivities led to the discovery of complex cascade processes in a full atom economy, completely stereoselective fashion.

The cycloisomerizations of $1, n$-enynes in the absence of nucleophiles underwent a wide variety of skeletal rearrangements affording very different carbo- and heterocyclic products. ${ }^{3}$ However, these trasnsformations were limited from 1,5- to 1,8 -enynes, which are entropically favoured. In the absence of a tether strain, very few intermolecular reactions were described. ${ }^{4}$ As an example, the [2+2] cycloaddition between alkynes and alkenes using [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{SbF}_{6}(\mathbf{E})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $25{ }^{\circ} \mathrm{C}$ led to the regioselective formation of cyclobutene scaffolds such as $\mathbf{1}$ in good yields (Scheme 1). ${ }^{5}$

Scheme 1. [2+2] Cycloaddition of alkynes and alkenes.
These transformations were suggested to proceed through cyclopropyl gold carbenes like 2. An interesting debate was centred on the nature of these intermediates as a goldstabilized homoallyl carbocation ( $\mathbf{2}^{\prime}$ ) could be also conceived. Further studies indicated the involvement of gradually distorted carbenes depending on the substitution pattern and the ligand on the metal. ${ }^{6}$

In Chapter 1, we developed the gold-catalyzed macrocyclization of large $1, n$-enynes ( $n \geq$ 9) via a $\left[2+2\right.$ ] cycloaddition. ${ }^{7}$ In organic synthesis, forging 8 - to 16 - membered rings is not

[^88]a straightforward process and the methodology presented several challenges. ${ }^{8}$ Optimization of the reaction conditions allowed the cyclization of 1,14-enyne $\mathbf{3}$, bearing a spacer between both reacting partners, towards the macrocyclic structure $\mathbf{4}$ in good isolated yield (Scheme 2).

## Scheme 2. Macrocyclization of large enynes.

In general, the reactions were carried out under mild conditions although some substrates required an increment of the temperature and/or the reaction concentration; for example, 1,10 -enyne 5 demanded $45^{\circ} \mathrm{C}$ to form macrocycle 6 (Scheme 3 ). Nevertheless, expansion of the reaction scope showed that the macrocyclization proceeded in moderate to good yields drastically depending on each substrate: the chain length, the spacer and the substituents.

## Scheme 3. Macrocyclization under harsher conditions.

This methodology also provided access to $m$-cyclophanes such as $\mathbf{7}$ or $\mathbf{8}$, which exhibit interesting chemical and physical properties applied in supramolecular chemistry and material science (Figure 1). ${ }^{9}$

7

8

Figure 1. m-Cyclophanes synthesized via gold catalysis.
Subsequently to the gold activation and the nucleophilic attack, the intermediates formed could evolve though many different pathways affording a wide variety of products, for example, via trapping with nucleophiles or cyclopropanation. ${ }^{1,3,10}$ Despite these major

[^89]advances, the presence of intermolecular cycloadditions in the literature was rather limited due to the competitive binding of the different unsaturated substrates with the gold complex. Striding forward, in Chapter 2 we developed an intermolecular gold-catalyzed cascade $[2+2+2]$ cycloaddition of an alkyne, an alkene and a carbonyl group. ${ }^{11}$ Thus, $m$ methoxyethynylbenzene reacted with 5-methylhex-5-en-2-one and catalyst $\mathbf{E}$ at $50^{\circ} \mathrm{C}$ to form oxabicycle 9 in $91 \%$ isolated yield (Scheme 4).

Scheme 4. [2+2+2] Cycloaddition of alkynes and oxoalkenes.
In most cases, the multistep mechanistic proposals of these reactions were rather complex and the isolation of key intermediates was proven to be challenging. ${ }^{12}$ Therefore, its understanding was based often on analogy and speculation. Thus, in Chapter 3 we performed a detailed mechanistic study of the intermolecular [2+2+2] cycloaddition of alkynes and oxoalkenes. ${ }^{11}$ The initial framework was the selective $\pi$-coordination of the gold complex to the alkyne (10) allowing the nucleophilic attack of the oxoalkene to build the cyclopropyl gold carbene 11 (Scheme 5).

Scheme 5. Mechanistic proposal supported computationally (relative energies in kcal/mol).

This intermediate would undergo an intramolecular nucleophilic attack of the carbonyl group to form an oxonium cation (12) followed by a Prins-type cyclization with the alkenyl gold scaffold to 13. Demetalation would afford the coordinated product $\mathbf{1 4}$ and complex 10 after ligand exchange. This proposal was supported by DFT calculations $\left(\mathrm{M} 06,6-31 \mathrm{G}(\mathrm{d})(\mathrm{C}, \mathrm{H}, \mathrm{P}, \mathrm{O})\right.$ and $\mathrm{SDD}(\mathrm{Au})$ in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, which suggested that the rate-

[^90]detemining step of the process was the nucleophilic attack of the alkene towards the activated alkyne.

The scope of this methodology was expanded to 24 examples with good to excellent yields. The process showed a broad functional tolerance in the substitution of the aryl ring with both electron-deficient and electron-donating groups and including hetero- and polyaromatic moieties. Furthermore, varying the substituents in the alkene group and in the $\alpha$-position of the ketone was also possible leading to a better efficiency by increasing their nucleophilicity. Interestingly, changing the substitution pattern of the olefin or utilization of an ester headed to the preferential formation of cyclobutenes such as $\mathbf{1 5}$ or $\mathbf{1 6}$ in $54 \%$ and $47 \%$ yield, respectively (Figure 2).

Figure 2. Preferential formation of cyclobutenes.
Therefore, the intramolecular nucleophilic attack of the carbonyl to a cyclopropyl gold carbene analogous to $\mathbf{1 1}$ was not favoured in those cases. Similarly, the reaction with the cyclic oxoalkene $\mathbf{1 7}$ afforded tricyclic structure $\mathbf{1 8}$ only in $31 \%$ isolated yield (Scheme 6).

## Scheme 6. Formation of a tricyclic scaffold.

Simultaneously, we could optimize the transformation towards a new reaction pathway that led to the formation of tetrahydrofurans such as $\mathbf{1 9}$ (Scheme 7). ${ }^{11}$ Thus, reaction between $p$-bromoethynylbenzene and 5-methylhex-5-en-2-one with substoichiometric amounts of $p$-toluenesulfonic acid built 19 in $51 \%$ isolated yield.

Scheme 7. Tuning of the reaction towards tetrahydrofurans.

We suggested that the $\pi$-coordinated gold complex with the alkyne (20) could undergo deprotonation forming 21 and releasing acid in the reaction media. ${ }^{13}$ A proton-catalyzed cyclization of the oxoalkene would form cation 22/22', which would be in equilibrium with 23. This intermediate could be easily trapped with 21 affording the tetrahydrofuran product 19 (Scheme 8). This proposal was supported with deuterium labelling experiments.

Scheme 8. Mechanistic proposal supported by deuterium labelling experiments.
Moreover, we developed an unprecedented gold-catalyzed trimerization of alkynes that led to $1,3,5$-substituted benzenes such as $\mathbf{2 4}$ in moderate yields (Scheme 9). ${ }^{11}$

## Scheme 9. Gold-catalyzed trimerization of alkynes.

Monitoring of the $[2+2+2]$ cycloaddition by ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy revealed a single gold species during the whole transformation. Crystallization of the resting state revealed digold complex 25 (Figure 3). ${ }^{11,14}$

[^91]

Figure 3. Digold complex 25 as the resting state.
This result suggested a more complex scenario. The formation was suggested to proceed via a competitive deprotonation of $\mathbf{1 0}$ to build $\mathbf{2 6}$ and reaction with another unit of catalyst $\mathbf{E}$ (Scheme 10). Determination of the equilibrium constant by the Van't Hoff equation proved this is a reversible process $\left(\mathrm{K}_{\mathrm{eq}}\left(50^{\circ} \mathrm{C}\right)=1.08 \cdot 10^{-7} \mathrm{M} ; \Delta \mathrm{H}=6.79 \mathrm{kcal} / \mathrm{mol} ; \Delta \mathrm{S}=\right.$ $-11 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K})$.

Scheme 10. Equilibrium between the involved gold species ( $L==^{t}$ BuXPhos).
Furthemore, we could detect complex 10 spectroscopically at $-78^{\circ} \mathrm{C}$ by observing the correlation between the proton of the alkyne and the phosphorous of the ligand. ${ }^{15}$ Low temperature NMR studies revealed that this complex coexists with digold scaffold $\mathbf{2 5}$ to $-20^{\circ} \mathrm{C}$, when it disappeared. Attempts to disclose the role of the digold complex in catalysis showed that this species were outside the catalytic cycle, which lowers the concentration of the active species $\mathbf{1 0}$ and explains the rather long reaction times. Digold complex 25 was unreactive until $\mathrm{HSbF}_{6}$ was added to re-establish the equilibrium between the gold species, for example, in the synthesis of oxabicycle 27 (Scheme 11).

Scheme 11. Regeneration of the catalytic activity ( $L={ }^{t}$ BuXPhos).
These results shed light into the complex scenario composed in a gold-catalyzed intermolecular cycloaddition. In this context, we focused on tuning the catalyst structure to

[^92]minimize the generation of digold complexes such as $\mathbf{2 5}$ and we reasoned that the use of more bulky, non-coordinating and less basic counterions could slow down the deprotonation of the alkynes and hamper the formation of the $\sigma$-alkynyl gold intermediates such as 26. ${ }^{16,17}$ Hence, we designed new gold complexes using $\mathrm{BAr}_{4}{ }_{4}{ }^{-}$as the anion, for example, catalyst $\mathbf{Q}$ (Figure 4).

Figure 4. New gold complex $Q$ bearing $\boldsymbol{B A r}^{F}{ }_{4}-$
This hypothesis was validated by performing a study of the anion effect in several goldcatalyzed intermolecular cycloadditions, which led to improvements up to $36 \%$ isolated yield. As an example, $p$-chloroethynylbenzene reacted with a slight excess of $\alpha$ methylstyrene under the optimized conditions and led to cyclobutene 28 in $61 \%$ when using $\mathrm{SbF}_{6}{ }^{-}$and $91 \%$ with $\mathrm{BAr}^{\mathrm{F}}{ }_{4}{ }^{-}$(Scheme 12). ${ }^{5}$ Moreover, the same trend was observed in the macrocyclization of large enynes, ${ }^{7}$ the gold-catalyzed synthesis of phenols ${ }^{18}$ and the $[2+2+2]$ cycloaddition of alkynes with oxoalkenes. ${ }^{11}$ On the other hand, no pattern was observed in the intramolecular cyclizations. ${ }^{3,10 a, 19}$

Scheme 12. Anion effect in the intermolecular cycloadditions.
In order to further understand this influence, we studied mechanistically the particular involvement of the couterion in the intermolecular [2+2] cycloaddition of alkynes with alkenes. ${ }^{17}{ }^{1} \mathrm{H}$ NMR monitoring of the transformation between ethynylbenzene and $\alpha$ methylstyrene afforded the kinetic profile of the reaction and showed the great dependence with the anion. Thus, the final yield and the reaction rate increased along with its bulkiness: $\mathrm{BAr}_{4}{ }_{4}^{-}>\mathrm{SbF}_{6}^{-}>\mathrm{BF}_{4}^{-}$. Additionally, ${ }^{31} \mathrm{P}$ NMR spectroscopy showed the presence of digold scaffolds analogous to $\mathbf{2 5}$ together with a major new gold species, which could be crystallized as the $\pi$-coordinated gold complex with $\alpha$-methylstyrene 29 (Figure 5). ${ }^{11}$

[^93]

Figure 5. ( $\alpha$-Methylstyrene)gold(I) complex 29.
Interestingly, the ratios between the alkene versus the alkyne coordination changed dramatically with the counterion following the same trend: $\mathrm{BAr}_{4}^{-}>\mathrm{SbF}_{6}^{-}>\mathrm{BF}_{4}^{-}$. These results implied a larger reservoir of the cationic gold species in the reaction media. Determination of the equilibrium constant towards the digold complex showed it is slightly more favoured with smaller counterions: $\operatorname{Keq}\left(25{ }^{\circ} \mathrm{C}\right)=4.44 \cdot 10^{-8} \mathrm{M}$ for $\mathrm{SbF}_{6}{ }^{-}$and $\operatorname{Keq}(25$ $\left.{ }^{\circ} \mathrm{C}\right)=2.44 \cdot 10^{-8} \mathrm{M}$ for $\mathrm{BAr}^{\mathrm{F}}{ }_{4}^{-}$. Notably, the enthalpy increased to $13.4 \mathrm{kcal} / \mathrm{mol}$ whereas the entropy turned $10 \mathrm{cal} / \mathrm{mol} \cdot \mathrm{K}$. Performing the low temperature NMR studies with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}(\mathbf{Q})$ showed that the $\pi$-coordinated gold complex with the alkyne analogous to $\mathbf{1 0}$ was this time stable up to $0^{\circ} \mathrm{C}$, when the digold complex $\mathbf{2 5}$-type was also formed (Scheme 13). These results were supported by DFT calculations as well.

Scheme 13. Evolution of the different gold species by increasing the temperature ( $L==^{t}$ BuXPhos).

Furthermore, we measured the equilibrium constants towards the alkene complexes like 29 to observe that the binding to $\alpha$-methylstyrene was stronger with bulky counterions, although the differences were small again: $\operatorname{Keq}\left(25{ }^{\circ} \mathrm{C}\right)=0.047$ for $\mathrm{SbF}_{6}{ }^{-}$and $\operatorname{Keq}\left(25{ }^{\circ} \mathrm{C}\right)$ $=0.090$ for $\mathrm{BAr}_{4}{ }_{4}$. Nevertheless, their comparison with the formation of the digold complexes was remarkably distinct: the constants increased from $10^{-8}$ to $10^{-2}$.

Concurrently, the method of the initial rates showed order one for both the alkyne and the gold catalyst but zero-dependance for $\alpha$-methylstyrene. In the initial mechanistic proposal, the alkyne complex $\mathbf{1 0}$ was formed straightforward to undergo a rate-determining nucleophilic attack of the alkene and build a cyclopropyl gold carbene (30), analogous to 11 (Scheme 14). This intermediate was formed regioselectively and proceeded via ring expansion to form the stabilized carbocation 31 and the coordinated final product $\mathbf{3 2}$ after demetallation.

However, this proposal did not consider the pre-equilibrium described and did not explain the zero order observed for $\alpha$-methylstyrene. Therefore, according to the equilibrium constants, the gold catalyst should bind preferentially to $\alpha$-metylstyrene forming complex 29 in the presence of the ethynylbenzene, also decreasing 25 and 26 . The extent of this effect would depend on the nucleophilicity of the alkene as well as the stoichiometry of the reaction, as observed.

Therefore, it was mechanistically crucial to determine if complex 29 could lead directly to complex $\mathbf{1 0}$ as well, which would circumscribe if the coordination of the alkene was inhibiting the $[2+2]$ cycloaddition or storing cationic gold(I) reservoirs.

Scheme 14. Mechanistic proposal considering the counterion effect ( $L^{=}{ }^{t}$ BuXPhos).
Tests on the catalytic activity confirmed that digold complex 25 and 26 are off-cycle species, whose reactivity was restored upon an acid addition. Remarkably, complex 29 reacted stoichiometrically with ethynylbenzene in the absence of catalyst to forge cyclobutene 1 in $72 \%$ isolated yield (Scheme 15). Accordingly, the ligand exchange between complex 29 and ethynylbenzene to form the key intermediate $\mathbf{1 0}$ was the ratedetemining step of the catalytic cycle.

Scheme 15. Catalytic activity of ( $\alpha$-methylstyrene)gold complex 29.

Finally, we envisioned we could apply our findings in the total synthesis of rumphellaone A, a natural product that showed cytotoxicity towards leukemia tumor cells (Figure 6). ${ }^{20,21}$ This scaffold contains a trans cyclobutane that could be built via an asymmetric goldcatalyzed [2+2] cycloaddition of an alkyne and an oxoalkene followed by a diastereoselective hydrogenation.

Figure 6. Application of gold chemistry to total synthesis.
Our first approach consisted on using a silyloxyalkynylfuran (33) to perform the key goldcatalyzed reaction to obtain 34, $\mathbf{3 5}$ after a vinyligous methylation and the natural product after hydrogenation (Scheme 16). ${ }^{22,23}$ However, the cycloaddition was not very efficient and intermediate 34 was obtained only in $31 \%$ isolated yield.

Mel

[Au]

## Scheme 16. Silyloxyalkynylfuran approach.

Therefore, we changed the strategy towards a gold-catalyzed [2+2] cycloaddition with ethynylbenzene followed by the oxidation of the aromatic ring to obtain a carboxylic acid, which could be transformed to the desired lactone via stereoselective allylation and an intramolecular reverse Wacker oxidation. ${ }^{24,25}$

[^94]Thus, reaction of ethynylbenzene with 5-methylhex-5-en-2-one and $5 \mathrm{~mol} \%$ of catalyst $\mathbf{Q}$ afforded cyclobutene 15 in $78 \%$ isolated yield under the optimized conditions (Scheme 17). Attempts to perform a diastereoselective hydrogenation were unsuccessful and $90 \%$ cyclobutane 36 (1.6:1) was obtained with $10 \mathrm{~mol} \%$ of $\mathrm{Pd} / \mathrm{C}$ in methanol under 1 atm of $\mathrm{H}_{2}$. Oxidation with $\mathrm{RuO}_{2}$ afforded the carboxylic acid 37 in $80 \%$ isolated yield, which was followed by esterification ( $91 \%$ to $\mathbf{3 8}$ ) and protection of the ketone moiety (quantitatively to 39). A late stage isomerization afforded trans-39 in $77 \%$ isolated yield (97:3) after treatment with sodium methoxide in THF:methanol (1:1) at $70{ }^{\circ} \mathrm{C}$ for 20 h under strict anhydrous conditions. Formation in situ of the corresponding Weinreb amide trans-40 followed by a methylation reaction afforded our last intermediate trans-41 in $65 \%$ isolated yield. The already mentioned stereoselective allylation to $\mathbf{4 2}$ followed by a reverse Wacker oxidation to obtain rumphellaone A are on going work.

## Scheme 17. Towards the total synthesis of Rumphellaone A.

Furthermore, attempts to perform an enantioselective intermolecular gold-catalyzed [2+2] cycloaddition between an alkyne and an oxoalkene were carried out. Initially, we designed a substrate-induced asymmetric reaction via a chiral acetal protecting the carbonyl group (Scheme 18). ${ }^{26}$

[^95]

Scheme 18. Substrate-induced gold-catalyzed [2+2] cycloaddition.

Although acetal 43 afforded cyclobutene 44 in $50 \%$ isolated yield, the corresponding BINOL-derivative could not be formed.

Therefore, preliminar screenings of chiral gold complexes were performed. So far, cyclobutene 15 could be forged in $61 \%$ isolated yield ( $69 \%$ conversion) with $30 \%$ ee using catalyst $\mathbf{Y}$ under the optimized conditions (Scheme 19). ${ }^{27}$ Although this result is still modest, it proved the feasibility of this approach and encouraged us to continue this project.

Scheme 19. Enantioselective gold-catalyzed [2+2] cycloaddition.

## Experimental Section

Unless otherwise stated, reactions were carried out under argon atmosphere in solvents dried by passing through an activated alumina column on a PureSolv ${ }^{\mathrm{TM}}$ solvent purification system (Innovative Technologies, Inc., MA). Analytical thin layer chromatography was carried out using TLC-aluminium sheets with 0.2 mm of silica gel (Merck $\mathrm{GF}_{234}$ ) using UV light as the visualizing agent and an acidic solution of vanillin in ethanol as the developing agent. Chromatograpy purifications were carried out using flash grade silica gel (SDS Chromatogel 60 ACC, $40-60 \mathrm{~mm}$ ) or automated flash chromatographer CombiFlash Companion. Preparative TLC was performed on $20 \mathrm{~cm} \times 20 \mathrm{~cm}$ silica gel plates ( 2.0 mm thick, catalogue number 02015, Analtech). Organic solutions were concentrated under reduced pressure on a Büchi rotary evaporator.

NMR spectra was recorded at 298 K on a Bruker Avance 400 Ultrashield and Bruker Avance 500 Ultrashield apparatus. Mass spectra was recorded on a Waters Micromass LCT Premier (ESI), Waters Micromass GCT (EI, CI) and Bruker Daltonics Autoflex (MALDI) spectrometers. Elemental analyses were performed on a LECO CHNS 932 micro-analyzer at the Universidad Complutense de Madrid. Melting points were determined using a Büchi melting point apparatus and are uncorrected.

Crystal structure determinations were carried out using a Bruker-Nonius diffractomer equipped with an APPEX 24 K CCD area detector, a FR591 rotating anode with $\mathrm{MoK}_{\mathrm{a}}$ radiation, Montel mirrors as monochromator and a Kryoflex low temperature device ( $\mathrm{T}=$ $173{ }^{\circ} \mathrm{C}$ ). Full-sphere data collection was used with w and j scans. Programs used: Data collection APEX-2, data reduction Bruker Saint V/.60A and absorption correction SADABS. Structure Solution and Refinement: Crystal structure solution was achieved using direct methods as implement in SHELXTL and visualized using the program XP. Missing atoms were subsequently located from difference Fourier synthesis and added to the atom list. Least-squares refinement on F2 using all measured intensities was carried out using the program SHELXTL. All non hydrogen atoms were refined including anisotropic displacement parameters.

Calculations were carried out with DFT using the M06 functional ${ }^{1}$ as implemented in Gaussian $09 .{ }^{2}$ The $6-31 \mathrm{G}(\mathrm{d})$ basis set ${ }^{3}$ was used for all atoms except gold, which was treated with SDD and the associated effective core potential. ${ }^{4}$ Frequency calculations were performed to characterize the stationary points as minima. The solvent effect was taken into account by single-point calculations using the polarizable continuum model (PCM), ${ }^{5,6,7,8}$ in particular IEF-PCM as implemented in Gaussian 09. Default options were

[^97]used, except that individual spheres were placed on all hydrogen atoms to get a more accurate cavity. The calculations were performed using $\mathrm{CH}_{2} \mathrm{Cl}_{2}(\varepsilon=8.93)$ as solvent. The standard Gibbs energies in dichloromethane $\left(\Delta \mathrm{G}_{\mathrm{DCM}}\right)$ were obtained by adding the solvation energies to the gas-phase Gibbs energies computed at 298 K . The same procedure was employed to calculate zero-point corrected energies in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

[^98]
## 1. Gold-Catalyzed Macrocyclization via Cycloaddition of $1, n$-Enynes ${ }^{1}$

All the reactants, ligands and the following reagents were purchased from commercial sources and used without further purification: 3,7-dimethyloct-6-en-1-ol, 2(hydroxymethyl)phenol, 3-bromoprop-1-yne, 2-hydroxybenzaldehyde, 2-(2-Methylprop-1-en-1-yl)phenol, (2-(prop-2-yn-1-yloxy)phenyl)methanol, 6-methylhept-5-en-2-ol, 1-(bromomethyl)-2-iodobenzene, 2-(3-methylbut-2-en-1-yl)phenol, 1-(bromomethyl)-2ethynylbenzene, 2-iodophenol, 1-bromo-3-methylbut-2-ene, (2-(pent-4-yn-1yloxy)phenyl)methanol, 1-(bromomethyl)-2-ethynylbenzene, (2-(hex-5-yn-1yloxy)phenyl)methanol, 7-bromo-2-methylhept-2-ene, 8-bromo-2-methyloct-2-ene, 5-iodopent-1-yne, 6-iodohex-1-yne, dimethyl 2-(but-3-yn-1-yl)malonate, pent-4-yn-1-ol and 3-ethynylphenol. (THT)AuCl and (2-(hex-5-yn-1-yloxy)phenyl)methanol were synthesized as reported. ${ }^{2,3}$ Enynes 19 and 27 were prepared according to the literature as well metal complexes $\mathbf{B}, \mathbf{C}, \mathbf{E}, \mathbf{I},\left[\mathbf{P t}^{\mathrm{II}}\right]$ and $\left[\mathbf{C u} \mathbf{u}^{\mathbf{I}}\right]^{4,5,6,7}$

## Preparation of Gold Complexes

## Chloro[(2',4',6'-triisopropyl-3,6-dimethoxy-1,1'-biphenyl-2-yl)di-tertbutylphosphinelgold(I)

Chloro(tetrahydrothiophene) gold(I) ( $66.1 \mathrm{mg}, 0.21 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.3 \mathrm{ml})$ and a solution of 2-(di-tert-butylphosphino)-2', $4^{\prime}, 6$ '-triisopropyl-3,6-dimethoxy-1,1'biphenyl ( $100.0 \mathrm{mg}, 0.21 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.7 \mathrm{ml})$ was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 1 h and the solvent was removed under reduced pressure. The crude was purified with a chromatographic column using a mixture $2: 1$ of cyclohexane:ethyl acetate to obtain the product as a white powder in $92 \%$ isolated yield ( $136.0 \mathrm{mg}, 0.19 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 7.07(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.03(\mathrm{~s}, 2 \mathrm{H}), 6.99\left(\mathrm{dd}, J=8.9 \mathrm{~Hz}, J\left({ }^{1} \mathrm{H}-\right.\right.$ $\left.\left.{ }^{31} \mathrm{P}\right)=3.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 3.83(\mathrm{~s}, 3 \mathrm{H}), 3.55(\mathrm{~s}, 3 \mathrm{H}), 2.97$ (quintet, $\left.J=7.0 \mathrm{~Hz}, 1 \mathrm{H}\right), 2.38$ (quintet, $J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.41\left(\mathrm{~d}, J\left({ }^{1} \mathrm{H}^{31} \mathrm{P}\right)=16.5 \mathrm{~Hz}, 18 \mathrm{H}\right), 1.37(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 6 \mathrm{H}), 1.27(\mathrm{~d}, J=$ $6.7 \mathrm{~Hz}, 6 \mathrm{H}), 0.86(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H})$. DEPTQ-135 NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 155.4$ $(\mathrm{s}, \mathrm{C}), 153.6\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=12.0 \mathrm{~Hz}, \mathrm{C}\right), 150.1(\mathrm{~s}, \mathrm{C}), 146.9(\mathrm{~s}, \mathrm{C}), 139.4\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=\right.$ $15.2 \mathrm{~Hz}, \mathrm{C}), 131.9\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=7.5 \mathrm{~Hz}, \mathrm{C}\right), 122.4(\mathrm{~s}, \mathrm{CH}), 119.7\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=37.4\right.$ $\mathrm{Hz}, \mathrm{C}), 114.7(\mathrm{~s}, \mathrm{CH}), 109.9(\mathrm{~d}, J=5.4 \mathrm{~Hz}, \mathrm{CH}), 55.2\left(\mathrm{CH}_{3}\right), 54.7\left(\mathrm{CH}_{3}\right), 40.9\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-\right.\right.$ $\left.\left.{ }^{31} \mathrm{P}\right)=25.5 \mathrm{~Hz}, \mathrm{C}\right), 34.5(\mathrm{CH}), 32.8\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{3} \mathrm{P}\right)=8.0 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 31.4(\mathrm{~s}, \mathrm{CH}), 25.5$ $\left(\mathrm{CH}_{3}\right), 24.5\left(\mathrm{CH}_{3}\right), 24.4\left(\mathrm{CH}_{3}\right) .{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(202 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 73.10$ (s). MALDI ${ }^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{31} \mathrm{H}_{49} \mathrm{AuClO}_{2} \mathrm{P}^{+}[\mathrm{M}]^{+} 716.2819$, found 716.2728 (13 ppm).

[^99](Acetonitrile) $\left[\left(2^{\prime}, 4^{\prime}, 6^{\prime}\right.\right.$-triisopropyl-3,6-dimethoxy-1,1'-biphenyl-2-yl)di-tertbutylphosphinelgold(I) hexafluoroantimonate ( $G$ )

This synthesis was realized inside the glove box and in the dark (aluminium foil). Chloro[(2',4',6'-triisopropyl-3,6-dimethoxy-1,1'-biphenyl-2-yl)di-tert-butylphosphine] gold(I) $(88.3 \mathrm{mg}, 0.13 \mathrm{mmol})$ and acetonitrile ( $0.2 \mathrm{ml}, 3.38$ $\mathrm{mmol})$ were added in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{ml})$. Then, a suspension of $\mathrm{AgSbF}_{6}(43.0 \mathrm{mg}, 0.13 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{ml})$ was added and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 15 min . The crude was filtered twice through Teflon 0.22 and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed to afford complex $\mathbf{G}$ as a white powder in $94 \%$ isolated yield (111.0 $\mathrm{mg}, 0.17 \mathrm{mmol}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right): \delta 7.07(\mathrm{~s}, 2 \mathrm{H}), 7.06(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1$ H), $6.99\left(\mathrm{dd}, J=8.9 \mathrm{~Hz}, J\left({ }^{1} \mathrm{H}-{ }^{31} \mathrm{P}\right)=3.8 \mathrm{~Hz}, 1 \mathrm{H}\right), 3.79(\mathrm{~s}, 3 \mathrm{H}), 3.46(\mathrm{~s}, 3 \mathrm{H}), 2.88$ (quintet, $J=7.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.29 (quintet, $J=6.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), $2.21(\mathrm{br} \mathrm{s}, 3 \mathrm{H}), 1.34\left(\mathrm{~d}, J\left({ }^{1} \mathrm{H}-\right.\right.$ $\left.\left.{ }^{31} \mathrm{P}\right)=17.3 \mathrm{~Hz}, 18 \mathrm{H}\right), 1.26(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 6 \mathrm{H}), 1.18(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H}), 0.81(\mathrm{~d}, J=6.6$ $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right): \delta 155.3(\mathrm{~s}), 153.6\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=11.9 \mathrm{~Hz}\right.$ ), $149.8(\mathrm{~s}), 148.5(\mathrm{~s}), 137.8\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=13.6 \mathrm{~Hz}\right), 132.5\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=7.6 \mathrm{~Hz}\right), 122.5$ ( s$), 119.3(\mathrm{~s}), 117.3\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=37.4 \mathrm{~Hz}\right), 116.1(\mathrm{~s}), 111.0\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}^{31} \mathrm{P}\right)=5.9 \mathrm{~Hz}\right)$, $55.3(\mathrm{~s}), 55.1(\mathrm{~s}), 41.3\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=27.3 \mathrm{~Hz}\right), 34.2(\mathrm{~s}), 32.7\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=7.1 \mathrm{~Hz}\right)$, 31.4 (s), 25.4 (s), 24.5 (s), 24.3 (s), 3.3 (s). ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $202 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}$ ): $\delta$ 70.5 (s). Structure confirmed by HMQC ${ }^{13} \mathrm{C}-{ }^{1} \mathrm{H}$ NMR and $\mathrm{HMBC}^{31} \mathrm{P}-{ }^{1} \mathrm{H}$ NMR. MALDI ${ }^{+}$ $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{31} \mathrm{H}_{49} \mathrm{AuO}_{2} \mathrm{P}^{+}\left[\mathrm{M}-\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{~F}_{6} \mathrm{NSb}\right]^{+} 681.3130$, found 681.3485 ( 52 ppm ). Anal. calcd. for $\mathrm{C}_{33} \mathrm{H}_{52} \mathrm{AuF}_{6} \mathrm{NO}_{2} \mathrm{PSb}$ : C, $41.35 ; \mathrm{H}, 5.47$; N, 1.46; found: C, 42.46; H, 5.44; N, 1.35. ## Procedures for the Preparation of $\mathbf{1 , n}$-Enynes

## 8-Bromo-2,6-dimethyloct-2-ene

Triphenylphosphine ( $4.310 \mathrm{~g}, 16.43 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40.0 \mathrm{ml})$ to give a colourless solution that was cooled in an ice bath. A solution of dibromine ( $0.77 \mathrm{ml}, 15.06 \mathrm{mmol}$ ) in tetrachloromethane ( 4.0 ml ) was added and the reaction mixture was stirred at $25{ }^{\circ} \mathrm{C}$ for 1 h . Then, a solution of pyridine ( $1.2 \mathrm{ml}, 15.06 \mathrm{mmol}$ ) and 3,7-dimethyloct-6-en-1-ol ( $2.5 \mathrm{ml}, 13.69 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4.0 \mathrm{ml})$ was added and it was stirred 5.5 h more. The crude was concentrated under reduced pressure and it was filtered through a plug of silica gel with cyclohexane to obtain 8-bromo-2,6-dimethyloct-2-ene as a colourless oil in $94 \%$ isolated yield ( $2.8226 \mathrm{~g}, 12.88 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 5.11-5.07(\mathrm{~m}, 1 \mathrm{H}), 3.49-3.44(\mathrm{~m}, 1 \mathrm{H}), 3.42-3.37(\mathrm{~m}, 1 \mathrm{H}), 2.05-1.93(\mathrm{~m}, 2 \mathrm{H})$, $1.93-1.85(\mathrm{~m}, 1 \mathrm{H}), 1.71-1.63(\mathrm{~m}, 2 \mathrm{H}), 1.69(\mathrm{~d}, J=1.0 \mathrm{~Hz}, 3 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.38-$ $1.31(\mathrm{~m}, 1 \mathrm{H}), 1.22-1.14(\mathrm{~m}, 1 \mathrm{H}), 0.90(\mathrm{~d}, J=6.5,3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$, $\mathrm{ppm}) \delta 131.6(\mathrm{~s}), 124.6(\mathrm{~s}), 40.2(\mathrm{~s}), 36.7(\mathrm{~s}), 32.2(\mathrm{~s}), 31.5(\mathrm{~s}), 25.9(\mathrm{~s}), 25.5(\mathrm{~s}), 19.0(\mathrm{~s})$, 17.8 (s).

## (2-((3,7-Dimethyloct-6-en-1-yl)oxy)phenyl)methanol

8-Bromo-2,6-dimethyloct-2-ene ( $2.506 \mathrm{~g}, 11.43 \mathrm{mmol}$ ), 2(hydroxymethyl)phenol ( $1.561 \mathrm{~g}, 12.57 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(7.90 \mathrm{~g}$, $57.2 \mathrm{mmol}), \mathrm{Cs}_{2} \mathrm{CO}_{3}(1.118 \mathrm{~g}, 3.43 \mathrm{mmol})$ and tetrabutylammonium iodide ( $42.0 \mathrm{mg}, 0.114 \mathrm{mmol}$ ) were dissolved in anhydrous acetone ( 18.0 ml ) to give a white suspension that was stirred at $60^{\circ} \mathrm{C}$ for 30 h . Then, the solvent was removed under reduced pressure and the crude was filtered in vacuum through celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed again and the product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford (2-((3,7-dimethyloct-6-en-1-yl)phenyl)methanol as a colourless oil in $90 \%$ isolated yield ( $2.703 \mathrm{~g}, 10.30 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.24$ (dd, $J=7.4 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.17(\mathrm{td}, J=8.0 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.86(\mathrm{td}, J=7.4 \mathrm{~Hz}$, $J=0.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.78(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.12-5.07(\mathrm{~m}, 1 \mathrm{H}), 4.62(\mathrm{~s}, 2 \mathrm{H}), 4.00-3.90(\mathrm{~m}$, $2 \mathrm{H}), 2.97(\mathrm{~s}, 1 \mathrm{H}), 2.07-1.92(\mathrm{~m}, 2 \mathrm{H}), 1.84-1.76(\mathrm{~m}, 1 \mathrm{H}), 1.67(\mathrm{~d}, J=0.84 \mathrm{~Hz}, 3 \mathrm{H}), 1.65$ $-1.51(\mathrm{~m}, 2 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.42-1.33(\mathrm{~m}, 1 \mathrm{H}), 1.25-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.93(\mathrm{~d}, J=6.6$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 156.5$ (s), 131.1 (s), 129.3 (s), 128.3 (s), 128.1
 $25.3(\mathrm{~s}), 19.4(\mathrm{~s}), 17.5(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{O}_{2}^{+}[\mathrm{M}+\mathrm{H}]^{+} 285.1831$, found 285.1823.

## 1-((3,7-Dimethyloct-6-en-1-yl)oxy)-2-((prop-2-yn-1-yloxy)methyl)benzene (29)

A solution of (2-((3,7-dimethyloct-6-en-1yl)oxy)phenyl)methanol ( $4.25 \mathrm{~g}, 16.2 \mathrm{mmol}$ ) in THF ( 20.0 ml ) was added to a suspension of $\mathrm{NaH} 60 \% \mathrm{wt}(972 \mathrm{mg}, 24.3 \mathrm{mmol})$ in THF ( 20.0 ml ) at $0^{\circ} \mathrm{C}$ under argon. The reaction mixture was stirred at $70{ }^{\circ} \mathrm{C}$ for 30 min . Then, a solution of 3-bromoprop-1yne $80 \%$ wt ( $2.345 \mathrm{ml}, 21.1 \mathrm{mmol}$ ) was added dropwise at 25 ${ }^{\circ} \mathrm{C}$. The solution was stirred under reflux for 12 h . The reaction mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with ethyl acetate. The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and filtered. The solvent was removed by rotary evaporation. The crude product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,14 enyne 29 as an orange oil in $93 \%$ isolated yield ( $4.5 \mathrm{~g}, 15 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right): \delta 7.50(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.34(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.04(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1$ H), $6.94(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.29-5.23(\mathrm{~m}, 1 \mathrm{H}), 4.77(\mathrm{~s}, 2 \mathrm{H}), 4.31(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 2 \mathrm{H})$, $4.14-4.05(\mathrm{~m}, 2 \mathrm{H}), 2.54(\mathrm{t}, J=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-2.13(\mathrm{~m}, 2 \mathrm{H}), 2.01-1.93(\mathrm{~m}, 1 \mathrm{H})$, $1.88-1.83(\mathrm{~m}, 1 \mathrm{H}), 1.83(\mathrm{~s}, 3 \mathrm{H}), 1.81-1.75(\mathrm{~m}, 4 \mathrm{H}), 1.73-1.67(\mathrm{~m}, 2 \mathrm{H}), 1.09(\mathrm{dd}, J$ $=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 156.8(\mathrm{~s}), 131.1$ (s), 129.3 (s), 128.9
 37.3 (s), 36.3 (s), 29.7 (s), 25.8 (s), 25.7 (s), 19.7 (s), 17.8 (s). $\mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{20} \mathrm{H}_{29} \mathrm{O}_{2}^{+}[\mathrm{M}+\mathrm{H}]^{+}$323.1987, found 323.1981.

## 2-(1-Hydroxy-2-methylpropyl)phenol

Dissolve 2-hydroxybenzaldehyde ( $10.99 \mathrm{~g}, 90.00 \mathrm{mmol}$ ) in diethyl ether $(200.0 \mathrm{ml})$ and cool the solution to $-78^{\circ} \mathrm{C}$. Isopropylmagnesium chloride ( $100 \mathrm{ml}, 200 \mathrm{mmol}$ ) was added dropwise and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 2 h . It was quenched with $\mathrm{HCl} 10 \%$ wt and an extraction
with acidic water and a mixture of diethyl ether and ethyl acetate was carried out. The organic layers were collected and the solvent was removed. The product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 2-(1-hydroxy-2-methylpropyl)phenol as a colourless oil in $24 \%$ isolated yield ( $3.517 \mathrm{~g}, 21.16 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 8.33$ (broad s, 1H), $7.10(\mathrm{td}, J=7.5 \mathrm{~Hz}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.86(\mathrm{dd}, J=7.5 \mathrm{~Hz}, J=$ $1.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.80(\mathrm{~d}, J=8.3,1 \mathrm{H}), 6.78(\mathrm{td}, J=7.3 \mathrm{~Hz}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.42(\mathrm{~d}, J=7.0$ $\mathrm{Hz}, 1 \mathrm{H}), 3.54($ broad s, 1H), 2.08-1.99 (m, 1H) , $1.00(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.81(\mathrm{~d}, J=6.8$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 155.6$ (s), 128.7 (s), 128.4 (s), 126.3 (s), 119.5 (s), 117.0 (s), 81.8 ( s$), 34.4$ (s), 19.3 (s), 18.2 (s).

## 2-(2-Methylprop-1-en-1-yl)phenol

2-(1-Hydroxy-2-methylpropyl)phenol (3.417 g, 20.56 mmol$)$ was dissolved in hexane $(100.0 \mathrm{ml})$ and the solution was transferred into a high pressure reactor. Then, it was heated to $170^{\circ} \mathrm{C}$ for 17 h . The solvent was removed and the product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 2-(2-methylprop-1-en-1-yl)phenol as an orange oil in $54 \%$ isolated yield ( $1.638 \mathrm{~g}, 11.05 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.10(\mathrm{td}, J=8.0$ $\mathrm{Hz}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.04(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.87(\mathrm{~d}, J=7.3,1 \mathrm{H}), 6.85(\mathrm{td}, J=7.4 \mathrm{~Hz}, J$ $=0.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.12(\mathrm{~s}, 1 \mathrm{H}), 5.34(\mathrm{~s}, 1 \mathrm{H}), 1.89(\mathrm{~s}, 3 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 152.9(\mathrm{~s}), 140.0(\mathrm{~s}), 130.0(\mathrm{~s}), 128.1$ (s), 124.8 (s), 120.1 (s), 118.9 (s), 114.9 (s), 25.8 (s), 19.4 (s).

## 1-(2-Methylprop-1-en-yl)-2-(pent-4-yn-1-yloxy)benzene (32)

2-(2-Methylprop-1-en-1-yl)phenol ( $500.0 \mathrm{mg}, 3.37 \mathrm{mmol}$ ), 5-chloropent1 -yne ( $0.39 \mathrm{ml}, 3.71 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(2.331 \mathrm{~g}, 16.87 \mathrm{mmol}), \mathrm{Cs}_{2} \mathrm{CO}_{3}$ $(1.099 \mathrm{~g}, 3.37 \mathrm{mmol})$ and $\mathrm{NaI}(55.6 \mathrm{mg}, 3.71 \mathrm{mmol})$ were dissolved in acetone $(20.0 \mathrm{ml})$ to give a white suspension. The reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for four days. The solvent was removed and the crude was filtered in vacuum and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,9-enyne $\mathbf{3 2}$ as an slightly pink oil in $56 \%$ isolated yield (404.3 $\mathrm{mg}, 1.887 \mathrm{mmol}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.17(\mathrm{dd}, J=7.3 \mathrm{~Hz}, J=1.6 \mathrm{~Hz}$, $1 \mathrm{H}), 7.12(\mathrm{td}, J=7.9 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.88(\mathrm{dd}, J=7.4, J=1.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.82(\mathrm{dd}, J=$ $8.3 \mathrm{~Hz}, J=0.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.30(\mathrm{~s}, 1 \mathrm{H}), 4.00(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.37(\mathrm{td}, J=7.1 \mathrm{~Hz}, J=2.7$ $\mathrm{Hz}, 2 \mathrm{H}), 2.00-1.94(\mathrm{~m}, 2 \mathrm{H}), 1.93(\mathrm{t}, \mathrm{J}=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.90(\mathrm{~d}, J=1.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.79(\mathrm{~d}, J=$ $1.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 156.2(\mathrm{~s}), 135.0(\mathrm{~s}), 130.4(\mathrm{~s}), 127.8(\mathrm{~s})$, 127.3 (s), 120.6 ( s), 120.1 (s), 111.7 (s), 83.5 (s), 68.8 (s), 66.5 ( s), 28.3 ( s), 26.6 (s), 19.5 (s), $15.2(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$215.1436, found 215.1438 .

## 1-(Hex-5-yn-1-yloxy)-2-(2-methylprop-1-en-1-yl)benzene (34)

2-(2-Methylprop-1-en-1-yl)phenol ( $500.1 \mathrm{mg}, 3.37 \mathrm{mmol}$ ), 6-chlorohex-1-yne ( $0.45 \mathrm{ml}, 3.71 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(2.331 \mathrm{~g}, 16.87 \mathrm{mmol}), \mathrm{Cs}_{2} \mathrm{CO}_{3}$ $(1.099 \mathrm{~g}, 3.37 \mathrm{mmol})$ and $\mathrm{NaI}(55.6 \mathrm{mg}, 3.71 \mathrm{mmol})$ were dissolved in acetone ( 20.0 ml ) to give a white suspension. The reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for four days. The solvent was removed and the crude was filtered in vacuum and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The product was purified with a silica gel column and
eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,10-enyne 34 as a yellow oil in $46 \%$ isolated yield ( $354.8 \mathrm{mg}, 1.554 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.17(\mathrm{dd}, J=7.8 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.11(\mathrm{td}, J=7.7$ $\mathrm{Hz}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.87(\mathrm{t}, J=7.5,1 \mathrm{H}), 6.78(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.32(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{t}, J=$ $6.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.23(\mathrm{td}, J=7.1 \mathrm{~Hz}, J=2.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.93(\mathrm{t}, \mathrm{J}=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.90(\mathrm{~d}, J=1.3$ $\mathrm{Hz}, 3 \mathrm{H}), 1.88-1.84(\mathrm{~m}, 2 \mathrm{H}), 1.79(\mathrm{~d}, J=1.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.70-1.65(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 156.3$ (s), 134.8 (s), 130.3 (s), 127.7 (s), 127.2 (s), 120.7 (s), 119.9 (s), 111.5 (s), $84.0(\mathrm{~s}), 68.6(\mathrm{~s}), 67.5(\mathrm{~s}), 28.2(\mathrm{~s}), 26.6(\mathrm{~s}), 25.2(\mathrm{~s}), 19.5(\mathrm{~s}), 18.1(\mathrm{~s})$. $\mathrm{APCI}^{+} m / z$ calcd for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$229.1592, found 229.1581.

## 1-(((3-Methylbut-2-en-1-yl)oxy)methyl)-2-(prop-2-yn-1-yloxy)benzene (36)

A suspension of $\mathrm{NaH} 60 \%$ wt ( $136.0 \mathrm{mg}, 3.39 \mathrm{mmol}$ ) in THF $(9.0$ ml ) was cooled in an ice bath and a solution of (2-(prop-2-yn-1yloxy)phenyl)methanol ( $500.0 \mathrm{mg}, 3.08 \mathrm{mmol}$ ) in THF ( 2.0 ml ) was added dropwise. The solution was stirred at $25^{\circ} \mathrm{C}$ for 20 min . Then, 1-bromo-3-methylbut-2-ene ( $0.36 \mathrm{ml}, 3.08 \mathrm{mmol}$ ) and tetrabutylammonium iodide ( $11.0 \mathrm{mg}, 0.031 \mathrm{mmol}$ ) in THF ( 2.0 ml ) was added carefully and it was stirred at $70^{\circ} \mathrm{C}$ for 12 h . The reaction mixture was quenched with 1 ml of methanol and the crude was filtered in vacuum through celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( 0 $100 \%$ ) using a CombiFlash chromatographer to afford 1,10 -enyne 36 as a slightly yellowish oil in $72 \%$ isolated yield ( $510.6 \mathrm{mg}, 2.217 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 7.40(\mathrm{dd}, J=7.6 \mathrm{~Hz}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{td}, J=7.8 \mathrm{~Hz}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.00$ ( $\mathrm{td}, J=7.3 \mathrm{~Hz}, J=1.0,1 \mathrm{H}), 6.94(\mathrm{dd}, J=8.3 \mathrm{~Hz}, J=0.8,1 \mathrm{H}), 5.44-5.39(\mathrm{~m}, 1 \mathrm{H}), 4.65$ (d, $J=2.4,2 \mathrm{H}), 4.54(\mathrm{~s}, 2 \mathrm{H}), 4.03(\mathrm{~d}, J=6.9,2 \mathrm{H}), 2.47(\mathrm{t}, J=2.3,1 \mathrm{H}), 1.73(\mathrm{~d}, J=0.8$, $3 \mathrm{H}), 1.65(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 155.0(\mathrm{~s}), 136.6$ (s), 128.9 (s), 128.2 (s), 127.7 ( s), 121.3 (s), 111.8 (s), 78.7 (s), 75.3 (s), 66.8 ( s$), 66.5$ ( s$), 55.9$ (s), 25.6 (s), 17.9 (s). $\mathrm{APCI}^{+} m / z$ calcd for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}_{2}^{+}[\mathrm{M}+\mathrm{H}]^{+}$253.1204, found 253.1192.

## 1-Ethynyl-2-(((6-methylhept-5-en-2-yl)oxy)methyl)benzene (38)

To a slurry of $\mathrm{NaH} 60 \%$ wt $(88.0 \mathrm{mg}, 2.20 \mathrm{mmol})$ in THF $(10.0 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$, a solution of 6-methylhept-5-en-2-ol (282.0 $\mathrm{mg}, 2.20 \mathrm{mmol}$ ) in THF ( 10.0 mL ) was added dropwise and stirred for 15 min . Thereafter, 1-(bromomethyl)-2-iodobenzene $(594.0 \mathrm{mg}, 2.00 \mathrm{mmol})$ in THF ( 10.0 mL ) was added over 10 minutes $0{ }^{\circ} \mathrm{C}$. The mixture was then stirred for 30 min at $0{ }^{\circ} \mathrm{C}$ and subsequently the temperature was increased to $75^{\circ} \mathrm{C}$ and further stirred for 17 h . The reaction was quenched by addition of methanol followed by water and acidification with $\mathrm{HCl} 10 \%$. After complete evaporation of solvents and water, the residue was filtered through a plug of silica and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solution was concentrated and the crude was dissolved in $\mathrm{Et}_{3} \mathrm{~N}(2.0 \mathrm{~mL})$. Bis(triphenylphosphine)palladium(II)dichloride ( $46.7 \mathrm{mg}, 0.07 \mathrm{mmol}$ ) and $\mathrm{CuI}(25.4 \mathrm{mg}, 0.13 \mathrm{mmol})$ were added and the mixture was degassed with argon. Ethynyltrimethylsilane $(0.30 \mathrm{~mL}, 2.00 \mathrm{mmol})$ was added via syringe and the solution was allowed to stir at $25^{\circ} \mathrm{C}$ for 20 h . After filtration through a plug of silica the solution was concentrated under reduced pressure. Finally, the residue was dissolved in THF ( 3.0 mL ) and methanol $(3.0 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(900.0 \mathrm{mg}, 6.52 \mathrm{mmol})$ was added portionwise. Then, the solution was allowed to reach $25{ }^{\circ} \mathrm{C}$ and stirred for 12 h . The crude was thereafter extracted using saturated $\mathrm{NH}_{4} \mathrm{Cl}$ and diethylether and dried over $\mathrm{MgSO}_{4}$. The crude product was purified with a silica gel column and eluted with cyclohexane:ethyl
acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,10 -enyne 38 as an orange oil in $44 \%$ isolated yield ( $216.3 \mathrm{mg}, 0.89 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.54(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{dd}, J=7.6,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.37(\mathrm{td}, J=7.6,1.4 \mathrm{~Hz}, 1 \mathrm{H})$, 7.23 (td, $J=7.6,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.16-5.11(\mathrm{~m}, 1 \mathrm{H}), 4.77(\mathrm{~d}, J=12.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.64(\mathrm{~d}, J=$ $12.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.62-3.54(\mathrm{~m}, 2 \mathrm{H}), 3.30(\mathrm{~s}, 1 \mathrm{H}), 2.14-2.07(\mathrm{~m}, 2 \mathrm{H}), 1.73-1.67(\mathrm{~m}, 4$ H), $1.70(\mathrm{~s}, 3 \mathrm{H}), 1.54-1.45(\mathrm{~m}, 1 \mathrm{H}), 1.25(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 141.7$ (s), 132.6 (s), 131.5 (s), 129.0 (s), 127.6 (s), 127.0 (s), 124.4 (s), 120.4 (s), 81.6 ( s ), 81.5 ( s$), 75.0(\mathrm{~s}), 68.2$ ( s$), 36.8(\mathrm{~s}), 25.7$ ( s$), 24.2$ ( s$), 19.7$ (s), 17.7 (s). $\mathrm{APCI}^{+} m / z$ calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$243.1743, found 243.1751.

1-Ethynyl-2-((2-(3-methylbut-2-en-1-yl)phenoxy)methyl)benzene (40)

To a solution of 2-(3-methylbut-2-en-1-yl)phenol ( $2.039 \mathrm{~g}, 12.50$ mmol ) in acetone ( 18.0 mL ) were added 1-(bromomethyl)-2ethynylbenzene ( $2.230 \mathrm{~g}, 11.42 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(7.90 \mathrm{~g}, 57.2 \mathrm{mmol})$, $\mathrm{Cs}_{2} \mathrm{CO}_{3}(1.118 \mathrm{~g}, 3.43 \mathrm{mmol})$ and $\mathrm{NaI}(17.0 \mathrm{mg}, 0.11 \mathrm{mmol})$. The reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 30 h and then filtered through a pad of celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed and the product was purified with a silica gel column eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford $1,10-$ enyne 40 as a pale yellow oil in $62 \%$ isolated yield ( $1.959 \mathrm{~g}, 7.09 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.77(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.71(\mathrm{dd}, 7.6,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{td}, J=$ $7.6,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.43-7.37$ (m, 2 H), 7.33 (td, $J 7.8,1.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), $7.12-7.08$ (m, 2 H$)$, $5.61-5.57(\mathrm{~m}, 1 \mathrm{H}), 5.46(\mathrm{~s}, 2 \mathrm{H}), 3.65(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.48(\mathrm{~s}, 1 \mathrm{H}), 1.95(\mathrm{~s}, 3 \mathrm{H})$, $1.89(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 156.5$ (s), 140.1 (s), 132.9 (s), 132.4 (s), 130.6 (s), 129.7 ( s ), 129.3 ( s ), 127.5 ( s$), 127.2$ ( s$), 127.1$ ( s$), 123.0$ ( s$), 121.1$ ( s$), 120.4$ (s), 111.8 (s), 82.7 (s), 81.2 (s), 68.1 (s), 29.1 (s), 26.0 (s), 18.0 (s). $\mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{20} \mathrm{H}_{21} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$277.1587, found 277.1598.

1-((3,7-Dimethyloct-6-en-1-yl)oxy)-2-iodobenzene

To a solution of 2-iodophenol ( $2.761 \mathrm{~g}, 12.55 \mathrm{mmol}$ ) in acetone ( 18.0 mL ) were added 8-bromo-2,6-dimethyloct-2ene ( $2.504 \mathrm{~g}, 11.43 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(7.90 \mathrm{~g}, 57.2 \mathrm{mmol})$, $\mathrm{Cs}_{2} \mathrm{CO}_{3}(1.118 \mathrm{~g}, 3.43 \mathrm{mmol})$ and tetrabutylammonium iodide $(42.0 \mathrm{mg}, 0.114 \mathrm{mmol})$. The reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 30 h and then filtered through a pad of celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed and the product was purified with a silica gel column eluted with cyclohexane:ethyl acetate ( 0 $100 \%$ ) using a CombiFlash chromatographer to afford 1-((3,7-dimethyloct-6-en-1-yl)oxy)-2-iodobenzene as a pale yellow oil in $99 \%$ isolated yield ( $4.054 \mathrm{~g}, 11.32 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.78(\mathrm{dd}, J=7.4,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.29(\mathrm{td}, J=8.0,1.5 \mathrm{~Hz}, 1 \mathrm{H})$, $6.81(\mathrm{~d}, J=8.1,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.70(\mathrm{td}, J=7.4,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.16-5.12(\mathrm{~m}, 1 \mathrm{H}), 4.10$ - $4.00(\mathrm{~m}, 2 \mathrm{H}), 2.10-1.97(\mathrm{~m}, 2 \mathrm{H}), 1.94-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.84-1.80(\mathrm{~m}, 1 \mathrm{H}), 1.70(\mathrm{~s}, 3$ H), $1.69-1.54(\mathrm{~m}, 1 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}), 1.48-1.39(\mathrm{~m}, 1 \mathrm{H}), 1.30-1.20(\mathrm{~m}, 1 \mathrm{H}), 0.99(\mathrm{~d}$, $J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 157.7$ (s), 139.4 (s), 131.3 (s), 129.4 ( s$), 124.7$ ( s$), 122.3$ ( s$), 112.1$ ( s$), 86.8$ ( s$), 67.5$ ( s$), 37.1$ ( s$), 36.0$ (s), 29.5 (s), 25.8 (s), 25.5 (s), 19.6 (s), 17.7 (s).

## ((2-((3,7-Dimethyloct-6-en-1-yl)oxy)phenyl)ethynyl)trimethylsilane

To a solution of 1-((3,7-dimethyloct-6-en-1-yl)oxy)-2iodobenzene ( $0.71 \mathrm{~g}, 1.98 \mathrm{mmol}$ ) in $\mathrm{Et}_{3} \mathrm{~N}(3.0 \mathrm{~mL})$ was added bis(triphenylphosphine)palladium dichloride ( 70 mg , 0.099 mmol ) and $\mathrm{CuI}(38 \mathrm{mg}, 0,198 \mathrm{mmol})$ under argon. Then, ethynyltrimethylsilane ( $0.43 \mathrm{~mL}, 2.97 \mathrm{mmol}$ ) was added to the reaction mixture. The solution was stirred at $25^{\circ} \mathrm{C}$ for 12 h . After filtration over a pad of celite, the solvent was removed by rotary evaporation. The crude product was purified by flashed chromatography over silica gel (cyclohexane:ethyl acetate 98:2) to afford the product as an yellow oil in $99 \%$ isolated yield ( $648 \mathrm{mg}, 1.97 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.47$ (dd, $J=7.4,1.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $7.28(\mathrm{td}, J=7.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $6.81-6.70(\mathrm{~m}, 2 \mathrm{H}), 5.22-5.18(\mathrm{~m}, 1 \mathrm{H}), 4.10-4.04(\mathrm{~m}, 2 \mathrm{H}), 2.16-2.04(\mathrm{~m}, 2 \mathrm{H})$, $1.98-1.84(\mathrm{~m}, 2 \mathrm{H}), 1.76(\mathrm{~s}, 3 \mathrm{H}), 1.74-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.64(\mathrm{~s}, 3 \mathrm{H}), 1.53-1.45(\mathrm{~m}, 1$ H), $1.35-1.26(\mathrm{~m}, 1 \mathrm{H}), 1.06(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.09(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 160.3$ (s), 133.7 (s), 131.0 (s), 129.9 (s), 124.9 (s), 120.2 (s), 112.9 (s),
 (s), 17.7 (s), 0.1 (s).

## 1-((3,7-Dimethyloct-6-en-1-yl)oxy)-2-ethynylbenzene (42)

To a solution of ( $648 \mathrm{mg}, 1.97 \mathrm{~m}$ ((2-((3,7-dimethyloct-6-en1 -yl)oxy)phenyl)ethynyl)trimethylsilane mol ) in methanol $(5.0 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(1.37 \mathrm{~g}, 9.87 \mathrm{mmol})$. The reaction mixture was stirred at $25{ }^{\circ} \mathrm{C}$ for 12 h and then quenched with quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with ethyl acetate. The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and filtered. The solvent was removed by rotary evaporation. The crude product was purified with a silica gel column and eluted with hexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,11-enyne $\mathbf{4 2}$ as a yellow oil in $75 \%$ isolated yield ( 380 mg , $1.48 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.48$ (dd, $J=7.5,1.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.29 (td, $J$ $=8.1,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.91-6.86(\mathrm{~m}, 2 \mathrm{H}), 5.18-5.14(\mathrm{~m}, 1 \mathrm{H}), 4.12-4.04(\mathrm{~m}, 2 \mathrm{H}), 3.28$ (s, 1 H$), 2.13-2.00(\mathrm{~m}, 2 \mathrm{H}), 1.95-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.82-1.75(\mathrm{~m}, 1 \mathrm{H}), 1.73(\mathrm{~s}, 3 \mathrm{H})$, $1.73-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.64(\mathrm{~s}, 3 \mathrm{H}), 1.49-1.42(\mathrm{~m}, 1 \mathrm{H}), 1.31-1.24(\mathrm{~m}, 1 \mathrm{H}), 1.01$ (dd, J $=6.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 160.3$ (s), 134.1 (s), 131.1 (s), 130.1

## 1-(Bromomethyl)-2-((3,7-dimethyloct-6-en-1-yl)oxy)benzene

To a solution of (2-((3,7-dimethyloct-6-en-1yl)oxy)phenyl)methanol ( $1.020 \mathrm{~g}, 3.89 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100.0 \mathrm{~mL})$ was added triphenylphosphine ( 1.835 g , 7.00 mmol ) under argon. The resulting solution was cooled in an ice bath and a solution of 1-bromopyrrolidine-2,5-dione ( $1.245 \mathrm{~g}, 7.00 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100.0 \mathrm{ml})$ was added. The reaction mixture was stirred for 12 h at $25^{\circ} \mathrm{C}$. Then, the solvent was removed and the product was purified with a silica gel column eluted with cyclohexane:ethyl acetate $(0-100 \%)$ using a CombiFlash chromatographer to afford 1-(bromomethyl)-2-((3,7-dimethyloct-6-en-1-yl)oxy)benzene as a yellow oil quantitatively ( $1.265 \mathrm{~g}, 3.89 \mathrm{mmol})$. This compound was not very stable so it was kept in the freezer. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.31(\mathrm{dd}, J=7.5,1.6 \mathrm{~Hz}, 1 \mathrm{H})$, 7.26 (td, $J=7.8,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.89(\mathrm{td}, J=7.5,0.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.86(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H})$, $5.14-5.10(\mathrm{~m}, 1 \mathrm{H}), 4.56(\mathrm{~s}, 2 \mathrm{H}), 4.10-4.02(\mathrm{~m}, 2 \mathrm{H}), 2.10-1.96(\mathrm{~m}, 2 \mathrm{H}), 1.92-1.86$ $(\mathrm{m}, 1 \mathrm{H}), 1.83-1.75(\mathrm{~m}, 1 \mathrm{H}), 1.68(\mathrm{~d}, J=0.40 \mathrm{~Hz}, 3 \mathrm{H}), 1.67-1.62(\mathrm{~m}, 1 \mathrm{H}), 1.61(\mathrm{~s}, 3$ H), $1.46-1.39(\mathrm{~m}, 1 \mathrm{H}), 1.28-1.22(\mathrm{~m}, 1 \mathrm{H}), 0.97(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 157.1$ (s), 131.4 (s), 130.9 (s), 130.2 (s), 126.3 (s), 124.8 (s), 120.5 (s), 111.8 (s), 66.6 (s), 37.2 (s), 36.3 (s), 29.6 (s), 29.2 (s), 25.9 (s), 25.6 (s), 19.7 (s), 17.8 (s).

## Dimethyl 2-(but-3-yn-1-yl)-2-(2-((3,7-dimethyloct-6-en-1-yl)oxy)benzyl)malonate (54)

To a suspension of $\mathrm{NaH} 60 \%$ wt ( $49.0 \mathrm{mg}, 1.23 \mathrm{mmol}$ ) in DMF ( 10.0 mL ) at $0^{\circ} \mathrm{C}$ under argon was added a solution of dimethyl 2-(but-3-yn-1-yl)malonate ( $249.0 \mathrm{mg}, 1.35 \mathrm{mmol}$ ) in DMF ( 2.5 mL ). The mixture was stirred for 10 min and then, a solution of 1-(bromomethyl)-2-((3,7-dimethyloct-6-en-1-yl)oxy)benzene ( $400.0 \mathrm{mg}, 1.23 \mathrm{mmol}$ ) in DMF ( 2.5 mL ) was added dropwise. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 19 h . The solution was extracted with diethyl ether and brine and the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and filtered. The solvent was removed by rotary evaporation. The crude product was purified with a silica gel column and eluted with hexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,15-enyne 54 as a pale yellow oil in $55 \%$ isolated yield ( $288.7 \mathrm{mg}, 0.67 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.18$ (ddd, $J=$ $8.2,7.5,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.95$ (dd, $J=7.5,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.88-6.79(\mathrm{~m}, 2 \mathrm{H}), 5.11$ (ddt, $J=$ $8.4,5.7,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.04-3.94(\mathrm{~m}, 2 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.30(\mathrm{~s}, 2 \mathrm{H}), 2.30$ - 2.21 (m, 2 H), $2.12-1.96(\mathrm{~m}, 4 \mathrm{H}), 1.94-1.86(\mathrm{~m}, 2 \mathrm{H}), 1.70-1.63(\mathrm{~m}, 5 \mathrm{H}), 1.61(\mathrm{~s}, 3$ H), $1.43-1.36(\mathrm{~m}, 1 \mathrm{H}), 1.30-1.14(\mathrm{~m}, 1 \mathrm{H}), 0.96(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 171.3$ (s), 157.6 (s), 131.3 (s), 131.1 (s), 128.4 (s), 124.7 (s), 124.2 (s), $120.2(\mathrm{~s}), 111.3(\mathrm{~s}), 83.8(\mathrm{~s}), 68.5(\mathrm{~s}), 66.5(\mathrm{~s}), 58.7(\mathrm{~s}), 52.3(\mathrm{~s}), 37.2(\mathrm{~s}), 35.9(\mathrm{~s}), 31.8$ (s), 31.3 (s), 29.7 (s), 25.7 (s), 25.5 (s), 19.6 (s), 17.7 (s), $14.5(\mathrm{~s}) . \mathrm{ESI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{26} \mathrm{H}_{36} \mathrm{O}_{5} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+} 451.2455$, found 451.2457.

## 1-((3,7-Dimethyloct-6-en-1-yl)oxy)-2-((pent-4-yn-1-yloxy)methyl)benzene (56)

A solution of pent-4-yn-1-ol ( $160.6 \mathrm{mg}, 1.909 \mathrm{mmol}$ ) in THF $(5.0 \mathrm{ml})$ was added to a suspension of $\mathrm{NaH} 60 \%$ wt $(74.8 \mathrm{mg}$, 1.870 mmol ) in THF ( 10.0 ml ) and the reaction mixture was stirred at $25{ }^{\circ} \mathrm{C}$ for 30 min . Then, a solution of $1-$ (bromomethyl)-2-((3,7-dimethyloct-6-en-1-yl)oxy)benzene ( $599.4 \mathrm{mg}, 1.843 \mathrm{mmol}$ ) and tetrabutylammonium iodide ( $10.0 \mathrm{mg}, 0.027 \mathrm{mmol}$ ) in THF $(5.0 \mathrm{ml})$ was added dropwise and it was stirred again at $25^{\circ} \mathrm{C}$ for four days. The reaction was quenched with 1 ml of methanol and the crude was filtered in vacuum through celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Then, the product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,16-enyne 56 as a yellowish oil in $26 \%$ isolated yield ( $154.8 \mathrm{mg}, 0.471 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.37(\mathrm{dd}, J=7.5 \mathrm{~Hz}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{td}, J=7.8 \mathrm{~Hz}, J=$ $1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.93(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.84(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.12-5.09(\mathrm{~m}, 1 \mathrm{H}), 4.55(\mathrm{~s}$, $2 \mathrm{H}), 4.04-3.96(\mathrm{~m}, 2 \mathrm{H}), 3.61(\mathrm{t}, J=6.1,2 \mathrm{H}), 2.32(\mathrm{td}, J=7.1, J=2.6,2 \mathrm{H}), 2.08-1.95$ $(\mathrm{m}, 2 \mathrm{H}), 1.92(\mathrm{t}, J=2.7,1 \mathrm{H}), 1.88-1.81(\mathrm{~m}, 3 \mathrm{H}), 1.74-1.67(\mathrm{~m}, 1 \mathrm{H}), 1.69(\mathrm{~s}, 3 \mathrm{H}), 1.65$ - $1.57(\mathrm{~m}, 1 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.44-1.37(\mathrm{~m}, 1 \mathrm{H}), 1.25-1.19(\mathrm{~m}, 1 \mathrm{H}), 0.96(\mathrm{~d}, J=6.6$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 156.6$ (s), 131.4 (s), 128.7 (s), 128.5 (s), 127.1 (s), 124.8 (s), 120.3 (s), 111.1 (s), 84.2 (s), 69.0 ( s$), 68.4$ (s), 67.7 (s), 66.3 (s), 37.2 (s), 36.3 ( s ), 29.7 ( s , 28.9 ( s ), 25.8 ( s$), 25.6$ ( s$), 19.7$ ( s$), 17.8$ ( s$), 15.4$ ( s$)$.

1-((3,7-Dimethyloct-6-en-1-yl)oxy)-2-((hex-5-yn-1-yloxy)methyl)benzene (58)

A solution of (2-((3,7-dimethyloct-6-en-1yl)oxy)phenyl)methanol ( $500.0 \mathrm{mg}, 1.906 \mathrm{mmol}$ ) in THF ( 2.0 ml ) was added to a suspension of $\mathrm{NaH} 60 \%$ wt ( 99.0 mg , $2.477 \mathrm{mmol})$ in THF ( 4.0 ml ) and the reaction mixture was stirred at $70^{\circ} \mathrm{C}$ for 30 min . When the solution had cooled down to $25^{\circ} \mathrm{C}$, a solution of 6-iodohex-1-yne ( $430.0 \mathrm{mg}, 2.067 \mathrm{mmol}$ ) in THF ( 2.0 ml ) was added dropwise and it was stirred again at $70^{\circ} \mathrm{C}$ for 12 h . The reaction was quenched with 1 ml of methanol, the solvent was removed under reduced pressure and the crude was filtered through a plug of silica with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Then, the product was purified with a silica gel column and eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,17-enyne $\mathbf{5 8}$ as a yellowish oil in $28 \%$ isolated yield (184.3 $\mathrm{mg}, 0.538 \mathrm{mmol}) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.37(\mathrm{dd}, J=7.5 \mathrm{~Hz}, J=1.4 \mathrm{~Hz}$, $1 \mathrm{H}), 7.20(\mathrm{td}, J=7.9 \mathrm{~Hz}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.92(\mathrm{t}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.82(\mathrm{~d}, J=8.1 \mathrm{~Hz}$, $1 \mathrm{H}), 5.12-5.09(\mathrm{~m}, 1 \mathrm{H}), 4.53(\mathrm{~s}, 2 \mathrm{H}), 4.02-3.94(\mathrm{~m}, 2 \mathrm{H}), 3.53(\mathrm{t}, J=6.3,2 \mathrm{H}), 2.02(\mathrm{td}$, $J=7.0, J=2.6,2 \mathrm{H}), 2.08-1.94(\mathrm{~m}, 2 \mathrm{H}), 1.92(\mathrm{t}, J=2.7,1 \mathrm{H}), 1.87-1.80(\mathrm{~m}, 1 \mathrm{H}), 1.76-$ $1.70(\mathrm{~m}, 3 \mathrm{H}), 1.68(\mathrm{~d}, J=0.5 \mathrm{~Hz}, 3 \mathrm{H}), 1.65-1.55(\mathrm{~m}, 3 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H}), 1.44-1.37(\mathrm{~m}$, $1 \mathrm{H}), 1.26-1.19(\mathrm{~m}, 1 \mathrm{H}), 0.95(\mathrm{~d}, J=6.6,3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 156.5$ (s), 131.2 (s), 128.5 (s), 128.3 (s), 127.2 (s), 124.7 (s), 120.2 (s), 111.0 (s), 84.3 (s), 70.0 (s), 68.4 (s), 67.5 (s), 66.2 (s), 37.1 (s), 36.2 ( s), 29.6 (s), 28.9 (s), 25.7 (s), 25.5 (s), 25.3 (s), 19.6 (s), $18.2(\mathrm{~s}), 17.7(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{23} \mathrm{H}_{35} \mathrm{O}_{2}^{+}[\mathrm{M}+\mathrm{H}]^{+} 343.2637$, found 343.2633 .

## 1-Ethynyl-3-((7-methyloct-6-en-1-yl)oxy)benzene (60)

To a solution of 3-ethynylphenol ( $1.485 \mathrm{~g}, 12.57 \mathrm{mmol})$ in acetone $(18.0 \mathrm{~mL})$ were added 8 -bromo-2-methyloct-2-ene ( $2.345 \mathrm{~g}, 11.43$ $\mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(7.90 \mathrm{~g}, 57.2 \mathrm{mmol}), \mathrm{Cs}_{2} \mathrm{CO}_{3}(1.118 \mathrm{~g}, 3.43 \mathrm{mmol})$ and tetrabutylammonium iodide ( $42.0 \mathrm{mg}, 0.114 \mathrm{mmol}$ ). The reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 30 h and then filtered through a pad of celite with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed and the product was purified with a silica gel column eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,12 -enyne $\mathbf{6 0}$ as a colourless oil in $82 \%$ isolated yield ( 2.271 g , $9.37 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.22(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.08(\mathrm{~d}, J=7.6$ $\mathrm{Hz}, 1 \mathrm{H}), 7.04-7.02(\mathrm{~m}, 1 \mathrm{H}), 6.91(\mathrm{dd}, J=7.6,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.17-5.11(\mathrm{~m}, 1 \mathrm{H}), 3.95(\mathrm{t}, J$ $=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.06(\mathrm{~s}, 1 \mathrm{H}), 2.05-1.98(\mathrm{~m}, 2 \mathrm{H}), 1.83-1.74(\mathrm{~m}, 2 \mathrm{H}) 1.71(\mathrm{~s}, 3 \mathrm{H}), 1.62(\mathrm{~s}$, $3 \mathrm{H}), 1.50-1.37(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 158.9$ (s), 131.5 (s), 129.4

The solvent was removed and the product was purified with a silica gel column eluted with cyclohexane:ethyl acetate ( $0-100 \%$ ) using a CombiFlash chromatographer to afford 1,16-enyne 62 as a colourless oil in $57 \%$ isolated yield $(1.946 \mathrm{~g}, 6.52 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 7.21(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.08(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.02(\mathrm{~s}, 1 \mathrm{H}), 6.90(\mathrm{dd}, J=8.4$, $2.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.13(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.94(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.05(\mathrm{~s}, 1 \mathrm{H}), 2.00-1.94$ (m, 2 H), 1.82-1.73 (m, 2 H), $1.70(\mathrm{~s}, 3 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.48-1.40(\mathrm{~m}, 2 \mathrm{H}), 1.39-1.29$ (m, 10 H ). ${ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 158.9(\mathrm{~s}), 131.1(\mathrm{~s}), 129.3(\mathrm{~s}), 124.9(\mathrm{~s})$, 124.4 (s), 123.0 (s), 117.6 ( s), 116.0 ( s), 83.7 (s), 76.8 (s), 68.1 (s), 29.9 (s), 29.6 ( s$), 29.5$ (s), 29.5 (s), 29.4 (s), 29.3 ( s ), 29.2 ( s ), 28.1 ( s ), 26.0 ( s$), 25.7$ ( s$) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{21} \mathrm{H}_{31} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$299.2369, found 299.2368.

## General Procedure for the Preparation of Macrocycles

To a solution of the $1, n$-enyne ( 1 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, gold(I) complex $\mathbf{C}$ ( $3 \mathrm{~mol} \%$ ) was added. The reaction mixture was stirred at $25{ }^{\circ} \mathrm{C}$ or under reflux until complete consumption of the starting material. The reaction was quenched with $0.05 \mathrm{ml}_{\text {of }} \mathrm{Et}_{3} \mathrm{~N}$, the solvent was removed under reduced pressure and the crude was analysed by quantitative ${ }^{1} \mathrm{H}$ NMR using 1,4-diacetylbenzene as internal standard. The product was purified by preparative-TLC using different gradients of cyclohexane and ethyl acetate to obtain the pure macrocycle as a mixture of diastereoisomers.

## 8,11,11-Trimethyl-7,8,9,10,10a,11,13,15-octahydro-6Hbenzo[b]cyclobuta[g/[1,5]dioxacyclotridecine (30)

Macrocycle 30 was synthesized following the general procedure using 1,14-enyne 29 ( $78.1 \mathrm{mg}, 0.26 \mathrm{mmol}$ ) and catalyst $\mathbf{C}(7.0$ $\mathrm{mg}, 7.8 \mu \mathrm{~mol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.007 \mathrm{M})$ at $25^{\circ} \mathrm{C}$. After 12 h , the product was obtained as a yellow oil in $57 \%$ isolated yield (44.5 $\mathrm{mg}, 0.15 \mathrm{mmol}$ ), diastereoselectivity $2.3: 1 .{ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.30-7.22$ (m, 2 H), 6.89-6.84 (m, 2 H), $6.10(\mathrm{~s}, 0.3 \mathrm{H}), 6.03(\mathrm{~s}, 0.7 \mathrm{H}), 4.59-4.56(\mathrm{~m}, 1 \mathrm{H}), 4.27(\mathrm{~d}$, $J=9.3 \mathrm{~Hz}, 0.7 \mathrm{H}), 4.22-4.12(\mathrm{~m}, 1.3 \mathrm{H}), 4.05-3.90(\mathrm{~m}, 3 \mathrm{H}), 2.47-2.43(\mathrm{~m}, 0.7 \mathrm{H})$, 2.26-2.22 (m, 0.3 H), 2.05-1.89 (m, 1H), 1.75-1.47 (m, 6 H$), 1.13$ (s, 2.1 H$), 1.12$ (s, 0.9 H), $1.06(\mathrm{~s}, 0.9 \mathrm{H}), 1.05(\mathrm{~s}, 2.1 \mathrm{H}), 0.99(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 0.9 \mathrm{H}), 0.95(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 2.1 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR for the major diastereoisomer ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 158.2$ (s), 146.8 (s), 141.2 ( s$), 131.8(\mathrm{~s}), 129.9(\mathrm{~s}), 126.3(\mathrm{~s}), 120.0(\mathrm{~s}), 111.3$ (s), 69.8 (s), 68.5 (s), 67.7 (s), 52.1 (s), 42.9 (s), 35.9 (s), 33.3 (s), 30.2 (s), 27.0 (s), 24.7 (s), 22.4 (s), 20.7 (s). ${ }^{13} \mathrm{C}$ NMR for the minor diastereoisomer ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 158.1$ (s), 146.6 (s), 142.8 (s), 130.1 (s), 130.0 (s), 126.0 (s), 119.9 (s), 110.9 (s), 69.8 (s), 68.9 (s), 67.0 (s), 55.8 (s), 42.7 (s), 35.2 (s), 34.9 (s), 34.1 (s), 30.5 (s), 29.1 (s), 22.2 (s), 21.0 (s). $\mathrm{ESI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{2} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+} 323.1982$; found 323.1989.

## 2,2,5-Trimethyl-2,2a,3,4,5,7-hexahydrobenzo[c]cyclobuta[e]oxonine (39)

Macrocycle 39 was synthesized following the general procedure using 1,10-enyne $38(63.0 \mathrm{mg}, 0.26 \mathrm{mmol})$ and catalyst $\mathbf{C}(7.0 \mathrm{mg}, 7.8 \mu \mathrm{~mol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.15 \mathrm{M})$ at $25^{\circ} \mathrm{C}$. After 19 h , the product was obtained as a yellow oil in $51 \%$ isolated yield ( $32.1 \mathrm{mg}, 0.13 \mathrm{mmol}$ ), diastereoselectivity 5:1. ${ }^{1} \mathrm{H}$ NMR for the major diastereoisomer (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.53-7.50(\mathrm{~m}, 1 \mathrm{H}), 7.32-7.25(\mathrm{~m}, 3 \mathrm{H}), 6.49(\mathrm{~s}, 1$ H), $4.99(\mathrm{~d}, J=12.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~d}, J=12.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.39-3.32(\mathrm{~m}, 1 \mathrm{H}), 3.07-3.04$ (m, 1 H), 1.93-1.79 (m, 2 H), 1.71-1.62 (m, 2 H), 1.24 (s, 3 H ), 1.13 (d, J=6.6 Hz, 3 H ), $1.10(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR for the major diastereoisomer $\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 148.0(\mathrm{~s})$, 140.0 (s), 136.1 (s), 133.7 (s), 131.2 (s), 127.8 (s), 127.7 (s), 127.6 (s), 71.6 (s), 66.5 (s), 57.2 (s), 42.6 (s), 37.1 (s), 28.7 (s), 27.1 (s), 22.6 (s), 22.4 (s). $\mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$243.1743, found 243.1747.

## 1,1-Dimethyl-1,7,13,13a- <br> tetrahydrodibenzo[b,g]cyclobuta[e]oxonine (41)

Table 5. Crystal data and structure refinement for macrocycle 41.

| Empirical formula | C 20 H 20 O |
| :--- | :--- |
| Formula weight | 276.36 |
| Temperature | $100(2) \mathrm{K}$ |
| Wavelength | $0.71073 \AA$ |
| Crystal system | Monoclinic |
| Space group | $\mathrm{P} 2(1) / \mathrm{c}$ |
| Unit cell dimensions | $\mathrm{a}=11.8987(3) \AA$ |
|  | $\alpha=90.00^{\circ}$. |
|  | $\mathrm{b}=6.0503(2) \AA$ |
|  | $\beta=104.9450(10)^{\circ}$. |
|  | $\mathrm{c}=21.0067(5) \AA$ |
|  | $\gamma=90.00^{\circ}$. |
| Volume | $1461.13(7) \AA^{3}$ |
| Z | 4 |
| Density (calculated) | $1.256 \mathrm{Mg} / \mathrm{m}^{3}$ |
| Absorption coefficient | $0.075 \mathrm{~mm} \mathrm{~m}^{-1}$ |
| $\mathrm{~F}(000)$ | 592 |
| Crystal size | $0.15 \mathrm{x} 0.10 \mathrm{x} 0.10 \mathrm{~mm}^{3}$ |
| Theta range for data collection | $1.77 \mathrm{to} 33.26^{\circ}$. |
| Index ranges | $-17<=\mathrm{h}<=16$, |
|  | $-8<=\mathrm{k}<=8$, |
| Reflections collected | $-31<=1<=31$ |
| Independent reflections | 12256 |
|  | 5049 |
| Completeness to theta $=33.26^{\circ}$ | $[\mathrm{R}($ int $)=0.0175]$ |
| Absorption correction | $0.896 \%$ |
| Max. and min. transmission | Empirical |
| Refinement method | 0.9925 and 0.9888 |
| Data / restraints / parameters | Full-matrix |
| Goodness-of-fit on $\mathrm{F}^{2}$ | least-squares on $\mathrm{F}^{2}$ |
| Final R indices [I>2sigma(I)] | $5049 / 0 / 192$ |
|  | 0.966 |
|  | $\mathrm{R} 1=0.0440$, |
|  | wR2=0.1165 |
|  |  |

| R indices (all data) | $\mathrm{R} 1=0.0521$, |
| :--- | :---: |
| Largest diff. peak and hole | wR2 $=0.1235$ |
| 0.535 and $-0.191 \mathrm{e} . \AA^{-3}$ |  |

Table 6. Bond lengths [A]] and angles [`] for macrocycle 41.

# 2. Gold-Catalyzed Intermolecular Cycloaddition of Alkynes and Oxoalkenes ${ }^{1}$ 

All the reactants, ligands and the following reagents were purchased from commercial sources and used without further purification: ethynylbenzene, 1-ethynyl-4-fluorobenzene, 1-ethynyl-4-chlorobenzene, 1-ethynyl-4-bromobenzene, 1-ethynyl-3-methylbenzene, 1-ethynyl-3-fluorobenzene, 1-ethynyl-3-chlorobenzene, 3-ethynylphenol, 1-ethynyl-3methoxybenzene, 1-ethynyl-2-methylbenzene, 2-ethynylnaphthalene, 3-ethynylthiophene, 1-ethynyl-4-nitrobenzene, 4-ethynylaniline, ethynylcyclohexane, ethynylcyclopropane, prop-2-yn-1-ylbenzene, 1-(4-ethynylphenyl)ethanone, 1-ethynyl-3,5bis(trifluoromethyl)benzene, 1-ethynyl-4-methoxybenzene, 1-ethynyl-4-methylbenzene, 5-methylhex-5-en-2-one, hex-5-en-2-one 53, ( $5 E, 9 E$ )-6,10,14-trimethylpentadeca-5,9,13-trien-2-one 57, 2,6-dimethylhept-5-enal 59, (Z)-dec-4-enal $\quad \mathbf{6 0}, \quad 3$-(2-methylallyl)dihydrofuran-2,5-dione 61, dimethyl 2-(2-phenylallyl)malonate 62, 6-methylhept-5-en-2-one, ethyl 4-methylpent-4-enoate and 1-(2-(prop-1-en-2yl)phenyl)ethanone 76. Catalysts $\mathbf{G}$ and $\mathbf{H}$ were described in Chapter 1. ${ }^{2}$ Gold complexes $\mathbf{A}, \mathbf{B}, \mathbf{E}, \mathbf{K}, \mathbf{L}, \mathbf{M}, \mathbf{N}, \mathbf{O}, \mathbf{9 4}(\mathrm{AuCl})_{2}, \mathbf{9 8}(\mathrm{AuCl})$ and $\mathbf{1 0 1}(\mathrm{AuCl})_{2}$ were synthesized according to the literature. ${ }^{34}$

## Procedures for the Preparation of Starting Materials

## 5-Phenylhex-5-en-2-one

Dry 1-butyl-3-methylimidazolium tetrafluoroborate $\left(\mathrm{BmimBF}_{4}\right)$ by setting it under vacuum at $80{ }^{\circ} \mathrm{C}$ for 24 h . Then, an oven-dried flask containing a stirring bar was charged with bromobenzene ( $1.57 \mathrm{~g}, 10.0$ mmol ) in $\mathrm{BmimBF}_{4}(20 \mathrm{ml})$, diacetoxypalladium ( $56.0 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) and 1,3-bis(diphenylphosphino)propane ( $0.21 \mathrm{~g}, 0.50 \mathrm{mmol}$ ) at $25^{\circ} \mathrm{C}$. After degassing the solution with $\mathrm{N}_{2}$ three times, hex-5-en-2-one ( $1.28 \mathrm{ml}, 11.0 \mathrm{mmol}$ ) and diisopropylamine $(1.70 \mathrm{ml}, 12.0 \mathrm{mmol})$ were injected sequentially. The reaction mixture was stirred at 115 ${ }^{\circ} \mathrm{C}$ for 36 h . The flask was cooled down to $25^{\circ} \mathrm{C}$ and the crude was extracted with diethyl ether washing with water and brine. The organic layers were dried with $\mathrm{MgSO}_{4}$, concentrated and the residue was purified with silica gel column chromatography using cyclohexane:ethyl acetate (30:1) as eluent. 5-Phenylhex-5-en-2-one was obtained in $23 \%$ isolated yield $(0.41 \mathrm{~g}, 2.32 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 7.40-7.38(\mathrm{~m}$, $2 \mathrm{H}), 7.35-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.30-7.26(\mathrm{~m}, 1 \mathrm{H}), 5.29(\mathrm{~s}, 1 \mathrm{H}), 5.07(\mathrm{q}, J=1.29 \mathrm{~Hz}, 1 \mathrm{H}), 2.81$ $-2.78(\mathrm{~m}, 2 \mathrm{H}), 2.60-2.57(\mathrm{~m}, 2 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ 208.27 (s), 147.30 (s), 140.74 ( s), 128.55 (s), 127.75 (s), 126.23 (s), 112.90 (s), 42.56 (s), 30.19 (s), 29.42 (s).

[^100]
## Ethyl 2-benzoyl-4-methylpent-4-enoate

To a suspension of $\mathrm{NaH} 60 \%(125 \mathrm{mg}, 3.12 \mathrm{mmol})$ in tetrehydrofuran ( 8
 ml ) at $0{ }^{\circ} \mathrm{C}$, ethyl 3-oxo-3-phenylpropanoate ( $0.45 \mathrm{ml}, 2.60 \mathrm{mmol}$ ) was added slowly. The solution was stirred for 10 min and then, 3-bromo-2-methylprop-1-ene ( $0.26 \mathrm{ml}, 2.60 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 16 h and quenched with water ( 2 ml ). After extraction with ethyl acetate, the organic layers were washed with brine and dried with $\mathrm{MgSO}_{4}$. The residue was purified by silica gel column chromatography with cyclohexane:ethyl acetate ( $25: 1$ ) to obtain ethyl 2-benzoyl-4-methylpent-4-enoate in $49 \%$ isolated yield $(0.31 \mathrm{~g}, 1.27 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 8.03-8.00(\mathrm{~m}$, $2 \mathrm{H}), 7.61-7.57(\mathrm{~m}, 1 \mathrm{H}), 7.50-7.46(\mathrm{~m}, 2 \mathrm{H}), 4.78(\operatorname{broad~s}, 1 \mathrm{H}), 4.72(\operatorname{broad~s}, 1 \mathrm{H}), 4.55$ (dd, $J=8.14,6.66 \mathrm{~Hz}, 1 \mathrm{H}), 4.14(\mathrm{qd}, J=7.15,0.87 \mathrm{~Hz}, 2 \mathrm{H}), 2.79-2.67(\mathrm{~m}, 2 \mathrm{H}), 1.77(\mathrm{~s}$, $3 \mathrm{H}), 1.17(\mathrm{t}, J=7.23 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 194.42(\mathrm{~s}), 169.50(\mathrm{~s})$, 142.21 (s), 136.56 (s), 133.47 (s), 128.92 (s), 128.72 (s), 112.30 (s), 61.34 (s), 52.93 (s), 36.65 (s), 21.69 (s), 14.01 (s).

## 4-Methyl-1-phenylpent-4-en-1-one (54)

Ethyl 2-benzoyl-4-methylpent-4-enoate ( $100 \mathrm{mg}, 0.41 \mathrm{mmol}$ ) was dissolved in a mixture 1:1 of water and THF $(2 \mathrm{ml})$. $\mathrm{LiOH}(30 \mathrm{mg}, 1.23$ mmol ) was added and the reaction mixture was stirred for 15 h at $50^{\circ} \mathrm{C}$. After quenching with aqueous $0.1 \mathrm{M} \mathrm{HCl}(3 \mathrm{ml})$, the solution was extracted with diethyl ether. The organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. The residue was purified with silica gel column chromatography with hexane:ethyl acetate (30:1) to obtain 4-methyl-1-phenylpent-4-en-1one 54 in $84 \%$ isolated yield ( $60 \mathrm{mg}, 0.35 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ $7.99-7.96(\mathrm{~m}, 2 \mathrm{H}), 7.59-7.54(\mathrm{~m}, 1 \mathrm{H}), 7.49-7.45(\mathrm{~m}, 2 \mathrm{H}), 4.77$ (broad s, 1H), 4.73 (broad s, 1H), $3.15-3.11(\mathrm{~m}, 2 \mathrm{H}), 2.46(\mathrm{t}, J=7.77 \mathrm{~Hz}, 2 \mathrm{H}), 1.79(\mathrm{~d}, J=0.49 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 199.71$ (s), 144.70 (s), 136.97 (s), 132.98 (s), 128.59 (s), 128.03 (s), 110.19 (s), 36.85 ( s , 31.90 (s), 22.76 (s).

## 4-Methylpent-4-enal (55)

To an anhydrous solution of ethyl 4-methylpent-4-enoate ( $0.56 \mathrm{ml}, 3.52$ mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-78^{\circ} \mathrm{C}$, diisobutylaluminium hydride 1 M in toluene ( $5.3 \mathrm{ml}, 5.3 \mathrm{mmol}$ ) was added over 5 min . The reaction mixture was stirred for 40 min and then quenched with a solution $1: 1$ of water and methanol $(20 \mathrm{ml})$. The solution was stirred for 3 h at $25^{\circ} \mathrm{C}$ and the resulting gel was filtered over a plug of $\mathrm{Na}_{2} \mathrm{SO}_{4} /$ celite washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed carefully ( 150 Torr, $25^{\circ} \mathrm{C}$ ) and the residue was purified with a silica gel column chromatography eluting with pentane - pentane:diethyl ether (20:1) to obtain 4-methylpent-4-enal 55 in $97 \%$ isolated yield ( $0.33 \mathrm{~g}, 3.41 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 9.74(\mathrm{t}, J=1.71 \mathrm{~Hz}, 1 \mathrm{H}), 4.76($ broad s, 1 H$), 4.68$ (broad s, 1H), $2.57-$ $2.53(\mathrm{~m}, 2 \mathrm{H}), 2.33(\mathrm{t}, J=7.41 \mathrm{~Hz}, 2 \mathrm{H}), 1.75-174(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$, $\mathrm{ppm}) \delta 202.57(\mathrm{~s}), 158.84(\mathrm{~s}), 110.76(\mathrm{~s}), 42.34$ ( s$), 30.37$ ( s ), $22.86(\mathrm{~s})$.

## Methyl 4-methyl-2-pivaloylpent-4-enoate

To a suspension of $\mathrm{NaH} 60 \%$ ( $152 \mathrm{mg}, 3.79 \mathrm{mmol}$ ) in tetrehydrofuran $(9.5 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$, methyl 3-oxo-3-phenylpropanoate $(0.51 \mathrm{ml}, 3.16 \mathrm{mmol})$ was added slowly. The solution was stirred for 10 min and then, 3-bromo-2-methylprop-1-ene ( $0.32 \mathrm{ml}, 3.16 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 15 h and quenched with water $(2 \mathrm{ml})$. After extraction with ethyl acetate, the organic layers were washed with brine and dried with $\mathrm{MgSO}_{4}$. The residue was purified by silica gel column chromatography with cyclohexane:ethyl acetate (50:1) to obtain methyl 4-methyl-2-pivaloylpent-4-enoate in $75 \%$ isolated yield $(0.51 \mathrm{~g}, 2.39 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 4.77$ (broad s, $1 \mathrm{H}), 4.71$ (broad s, 1H), 4.13 (dd, $J=7.91,6.17 \mathrm{~Hz}, 1 \mathrm{H}), 3.68$ (s, 3H), 2.61 (dd, $J=15.12$, $8.31 \mathrm{~Hz}, 1 \mathrm{H}), 2.42(\mathrm{dd}, J=14.90,6.36 \mathrm{~Hz}, 1 \mathrm{H}), 1.73(\mathrm{~s}, 3 \mathrm{H}), 1.17(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 209.26$ (s), 169.93 (s), 142.17 (s), 112.74 (s), 52.48 (s), 51.26 (s), 45.57 (s), 37.61 (s), 26.31 (s), 22.65 (s).

## 2,2,6-Trimethylhept-6-en-3-one (56)

Methyl 4-methyl-2-pivaloylpent-4-enoate ( $204 \mathrm{mg}, 0.96 \mathrm{mmol}$ ) was dissolved in a mixture $1: 1$ of water and THF $(5 \mathrm{ml})$. $\mathrm{LiOH}(69 \mathrm{mg}, 2.88$ mmol ) was added and the reaction mixture was stirred for 17 h at $50^{\circ} \mathrm{C}$. After quenching with aqueous $0.1 \mathrm{M} \mathrm{HCl}(9 \mathrm{ml})$, the solution was extracted with diethyl ether. The organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. The residue was purified with silica gel column chromatography with hexane:ethyl acetate (30:1) to obtain 2,2,6-trimethylhept-6-en-3-one 56 in $16 \%$ isolated yield ( $23 \mathrm{mg}, 0.15 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 4.72$ (broad s, 1H), $4.66($ broad s, 1H), $2.65-2.61(\mathrm{~m}, 2 \mathrm{H}), 2.25(\mathrm{t}, J=7.73 \mathrm{~Hz}, 2 \mathrm{H}), 1.74(\mathrm{~s}$, $3 \mathrm{H}), 1.15(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 215.40(\mathrm{~s}), 145.22(\mathrm{~s}), 110.01(\mathrm{~s})$, 44.32 ( s , 34.96 ( s$), 31.76$ ( s ), 26.62 ( s$), 22.89$ ( s$).$

## (E)-Ethyl 2-benzoylhex-4-enoate

To a suspension of $\mathrm{NaH} 60 \%(125 \mathrm{mg}, 3.12 \mathrm{mmol})$ in tetrehydrofuran ( 8 ml ) at $0{ }^{\circ} \mathrm{C}$, ethyl 3-oxo-3-phenylpropanoate ( $0.45 \mathrm{ml}, 2.60 \mathrm{mmol}$ ) was added slowly. The solution was stirred for 10 min and then, $(E)-1-$ bromobut-2-ene ( $0.26 \mathrm{ml}, 2.55 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25{ }^{\circ} \mathrm{C}$ for 19 h and quenched with water ( 2 ml ). After extraction with ethyl acetate, the organic layers were washed with brine and dried with $\mathrm{MgSO}_{4}$. The residue was purified by silica gel column chromatography with cyclohexane:ethyl acetate (30:1) to obtain ( $E$ )-ethyl 2-benzoylhex-4enoate in $57 \%$ isolated yield $(0.36 \mathrm{~g}, 1.47 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 8.00$ $-7.97(\mathrm{~m}, 2 \mathrm{H}), 7.60-7.56(\mathrm{~m}, 1 \mathrm{H}), 7.50-7.45(\mathrm{~m}, 2 \mathrm{H}), 5.59-5.50(\mathrm{~m}, 1 \mathrm{H}), 5.46-5.38$ $(\mathrm{m}, 1 \mathrm{H}), 4.35-4.31(\mathrm{~m}, 1 \mathrm{H}), 4.17-4.11(\mathrm{~m}, 2 \mathrm{H}), 2.74-2.61(\mathrm{~m}, 2 \mathrm{H}), 1.62(\mathrm{dd}, J=6.25$, $1.40 \mathrm{~Hz}, 3 \mathrm{H}), 1.17(\mathrm{t}, J=7.32 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 194.91(\mathrm{~s})$, 169.71 ( s), 136.45 ( s ), 133.58 ( s ), 128.84 ( s$), 128.76$ ( s$), 128.35$ ( s$), 127.09$ ( s$), 61.50$ (s), 54.74 (s), 32.15 (s), 18.03 (s), 14.19 (s).

## (E)-1-Phenylhex-4-en-1-one (58)

(E)-Ethyl 2-benzoylhex-4-enoate $(0.37 \mathrm{~g}, 1.45 \mathrm{mmol})$ was dissolved in a mixture $1: 1$ of water and THF ( 6 ml ). $\mathrm{LiOH}(0.10 \mathrm{~g}, 4.36 \mathrm{mmol})$
was added and the reaction mixture was stirred for 15 h at $50^{\circ} \mathrm{C}$. After quenching with aqueous $0.1 \mathrm{M} \mathrm{HCl}(9 \mathrm{ml})$, the solution was extracted with diethyl ether. The organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. The residue was purified with silica gel column chromatography with hexane:ethyl acetate ( $2: 1$ ) to obtain (E)-1-phenylhex-4-en-1-one 58 in $80 \%$ isolated yield ( $0.20 \mathrm{~g}, 0.16 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.97-7.95(\mathrm{~m}, 2 \mathrm{H}), 7.57-7.54(\mathrm{~m}, 1 \mathrm{H}), 7.47-7.44(\mathrm{~m}, 2 \mathrm{H}), 5.54-$ $5.48(\mathrm{~m}, 2 \mathrm{H}), 3.03(\mathrm{t}, J=7.51 \mathrm{~Hz}, 2 \mathrm{H}), 2.45-2.40(\mathrm{~m}, 2 \mathrm{H}), 1.66-1.64(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$, ppm) $\delta 199.95$ (s), 137.19 (s), 133.07 (s), 129.90 (s), 128.71 (s), 128.19 (s), 126.09 (s), 38.71 (s), 27.33 (s), 18.05 (s).

## N-(5-Methylhex-5-en-2-ylidene)benzamide (63)

Benzylamine ( $0.32 \mathrm{ml}, 2.94 \mathrm{mmol}$ ), 5-methyl-5-hexen-2-one ( 0.35 ml , $2.67 \mathrm{mmol})$ and 4 -methylbenzenesulfonic acid ( $10 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) were dissolved in toluene ( 10 ml ). Molecular sieves $4 \AA$ were added and the reaction mixture was stirred at $120{ }^{\circ} \mathrm{C}$ for 24 h . Then, the solution was cooled down and concentrated. The residue was dissolved in cyclohexane, filtered though filter paper and washed with saturated $\mathrm{NaHCO}_{3}$ and brine sequentially. The organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated. $N$-(5-Methylhex-5-en-2ylidene)benzamide 63 was obtained in $54 \%$ isolated yield ( $0.29 \mathrm{~g}, 1.44 \mathrm{mmol}$ ) and used immediately in the gold-catalyzed $[2+2+2]$ cycloaddition. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, $\mathrm{ppm}) \delta 7.35-7.31(\mathrm{~m}, 4 \mathrm{H}), 7.26-7.23(\mathrm{~m}, 1 \mathrm{H}), 4.73(\mathrm{~s}, 1 \mathrm{H}), 4.66(\mathrm{~s}, 1 \mathrm{H}), 3.87(\mathrm{~s}, 2 \mathrm{H})$, $2.58(\mathrm{t}, J=7.73 \mathrm{~Hz}, 2 \mathrm{H}), 2.28(\mathrm{t}, J=7.73 \mathrm{~Hz}, 2 \mathrm{H}), 2.16(\mathrm{~s}, 3 \mathrm{H}), 1.73(\mathrm{~s}, 3 \mathrm{H})$.

## 4-Methoxy-N-(5-methylhex-5-en-2-ylidene)aniline (64)

4-Methoxyaniline ( $0.36 \mathrm{~g}, 2.94 \mathrm{mmol}$ ), 5-methyl-5-hexen-2-one ( 0.35 ml , 2.67 mmol ) and 4-methylbenzenesulfonic acid ( $10 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) were dissolved in toluene $(10 \mathrm{ml})$. Molecular sieves $4 \AA$ were added and the reaction mixture was stirred at $120{ }^{\circ} \mathrm{C}$ for 24 h . Then, the solution was cooled down and concentrated. The residue was dissolved in cyclohexane, filtered though filter paper and washed with saturated $\mathrm{NaHCO}_{3}$ and brine sequentially. The organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated. 4-Methoxy- N -(5-methylhex-5-en-2ylidene) aniline 64 was obtained in $50 \%$ isolated yield ( $0.29 \mathrm{~g}, 1.34 \mathrm{mmol}$ ) and used immediately in the gold-catalyzed $[2+2+2]$ cycloaddition. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 6.85-6.83(\mathrm{~m}, 2 \mathrm{H}), 6.64-6.62(\mathrm{~m}, 2 \mathrm{H}), 4.76($ broad s, 2 H$), 3.79(\mathrm{~s}, 3 \mathrm{H}), 2.57-$ $2.53(\mathrm{~m}, 2 \mathrm{H}), 2.41-2.37(\mathrm{~m}, 2 \mathrm{H}), 1.80(\mathrm{~s}, 3 \mathrm{H}), 1.79(\mathrm{~s}, 3 \mathrm{H})$.

## Methyl 1-(2-methylallyl)-2-oxocyclohexanecarboxylate

To a suspension of $\mathrm{NaH} 60 \%(338 \mathrm{mg}, 8.45 \mathrm{mmol})$ in tetrehydrofuran (20 ml ) at $0{ }^{\circ} \mathrm{C}$, methyl 2-oxocyclohexanecarboxylate ( $1.00 \mathrm{ml}, 7.04 \mathrm{mmol}$ ) was added slowly. The solution was stirred for 10 min and then, 3-bromo-2-methylprop-1-ene ( $0.85 \mathrm{ml}, 8.45 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 19 h and quenched with water $(2 \mathrm{ml})$. After extraction with ethyl acetate, the organic layers were washed with brine and dried with $\mathrm{MgSO}_{4}$. The residue was purified by silica gel column chromatography with cyclohexane:ethyl acetate (20:1) to obtain methyl 1-(2-methylallyl)-2-oxocyclohexanecarboxylate in 37\% isolated yield ( 0.54 $\mathrm{g}, 3.46 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 4.82(\mathrm{dq}, J=2.32,1.46 \mathrm{~Hz}, 1 \mathrm{H}), 4.65$ (broad s, 1H), $3.71(\mathrm{~s}, 3 \mathrm{H}), 2.74(\mathrm{~d}, J=13.88 \mathrm{~Hz}, 1 \mathrm{H}), 2.54(\mathrm{dq}, J=13.81,2.80 \mathrm{~Hz}, 1 \mathrm{H})$, $2.49-2.43(\mathrm{~m}, 1 \mathrm{H}), 2.43-2.36(\mathrm{~m}, 1 \mathrm{H}), 2.33(\mathrm{~d}, J=13.81 \mathrm{~Hz}, 1 \mathrm{H}), 2.04-1.98(\mathrm{~m}, 1 \mathrm{H})$,
$1.79-1,71(\mathrm{~m}, 2 \mathrm{H}), 1.69-1.62(\mathrm{~m}, 4 \mathrm{H}), 1.48-1.40(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 207.32$ (s), 172.16 (s), 141.37 (s), 115.41 (s), 61.03 (s), 52.34 (s), 42.44 (s), 41.27 (s), 36.17 (s), 27.77 (s), 23.81 (s), 22.66 (s).

## 2-(2-Methylallyl) cyclohexanone (75)

Methyl 1-(2-methylallyl)-2-oxocyclohexanecarboxylate (162 mg, 0.78 mmol ) was dissolved in a mixture $1: 1$ of water and THF ( 4 ml ). LiOH (37 $\mathrm{mg}, 1.54 \mathrm{mmol}$ ) was added and the reaction mixture was stirred for 23 h at $50{ }^{\circ} \mathrm{C}$. After quenching with aqueous $0.1 \mathrm{M} \mathrm{HCl}(6 \mathrm{ml})$, the solution was extracted with diethyl ether. The organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$ and concentrated. 2-(2-Methylallyl)cyclohexanone 75 was obtained in $67 \%$ isolated yield ( $78 \mathrm{mg}, 0.51 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 4.79(\operatorname{broad~s,~} 1 \mathrm{H}), 4.74$ (broad s, $1 \mathrm{H}), 2.64-2.57(\mathrm{~m}, 1 \mathrm{H}), 2.45-2.31(\mathrm{~m}, 3 \mathrm{H}), 2.13(\mathrm{dd}, J=14.95,7.47 \mathrm{~Hz}, 1 \mathrm{H}), 1.75-$ $1.68(\mathrm{~m}, 4 \mathrm{H}), 1.68-1.65(\mathrm{~m}, 3 \mathrm{H}), 1.41-1.31(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ $\delta 180.60$ (s), 142.56 ( s), 112.64 (s), 43.99 (s), 40.60 (s), 33.94 (s), 31.77 (s), 26.36 (s), 24.75 (s), 22.33 (s).

## Cyclohex-1-en-1-ylmethanol

To a solution of $\mathrm{LiAlH}_{4}(0.34 \mathrm{~g}, 9.00 \mathrm{mmol})$ in diethyl ether ( 17 ml ), cyclohex-1-enecarboxylic acid ( $1.00 \mathrm{~g}, 7.93 \mathrm{mmol}$ ) was added at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred for 2 h and then quenched with a saturated solution of sodium potassium tartrate $(20 \mathrm{ml})$. The solution was stirred at $25^{\circ} \mathrm{C}$ for 1.5 h and then extracted with diethyl ether. The organic layers were dried with $\mathrm{MgSO}_{4}$ and concentrated. Cyclohex-1-en-ylmethanol was obtained in $87 \%$ isolated yield ( $0.78 \mathrm{~g}, 6.93$ mmol). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 5.69-5.67(\mathrm{~m}, 1 \mathrm{H}), 3.98(\mathrm{~s}, 2 \mathrm{H}), 2.06-1.99$ $(\mathrm{m}, 4 \mathrm{H}), 1.68-1.62(\mathrm{~m}, 2 \mathrm{H}), 1.61-1.55(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ 137.70 ( s ), 123.19 ( s ), 67.88 ( s$), 25.77$ ( s$), 25.07$ ( s$), 22.69$ ( s$), 22.59$ (s).

## 1-(Bromomethyl)cyclohex-1-ene

Cyclohex-1-en-1-ylmethanol ( $0.44 \mathrm{~g}, 3.88 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(7 \mathrm{ml})$, cooled to $0{ }^{\circ} \mathrm{C}$ and tribromophosphine $(0.16 \mathrm{ml}, 1.75 \mathrm{mmol})$ was added carefully. The reaction mixture was stirred for 3 h and diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solution was washed with saturated $\mathrm{NaHCO}_{3}$ and brine. The organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The residue was purified by silica gel column chromatography using pure cyclohexane to obtain 1-(bromomethyl)cyclohex-1-ene in $63 \%$ isolated yield ( $0.43 \mathrm{~g}, 2.43 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 5.88$ (broad s, 1H), $3.94(\mathrm{~s}, 2 \mathrm{H}), 2.13-2.11(\mathrm{~m}, 2 \mathrm{H}), 2.05-2.02(\mathrm{~m}, 2 \mathrm{H}), 1.70-1.65(\mathrm{~m}, 2 \mathrm{H})$, $1.60-1.55(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 134.81(\mathrm{~s}), 128.32(\mathrm{~s}), 40.04(\mathrm{~s})$, 26.53 (s), 25.65 ( s ), 22.56 ( s , 22.08 ( s$).$

## 3-(Cyclohex-1-en-1-yl)-1-phenylpropan-1-one (77)

Acetophenone ( $67 \mu 1,0.57 \mathrm{mmol}$ ) was dissolved in benzene ( 2 ml ) and potassium tert-butoxide ( $64 \mathrm{mg}, 0.57 \mathrm{mmol}$ ) was added slowly. After stirring for 30 min at $25{ }^{\circ} \mathrm{C}$, 1-(bromomethyl)cyclohex-1-ene in benzene ( 1 ml ) was added. The reaction mixture was then stirred at 25 ${ }^{\circ} \mathrm{C}$ for 1.5 h . It was quenched with brine, extracted with cyclohexane and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The residue was purified with silica gel preparative TLC with cyclohexane:ethyl
acetate (20:1) to obtain 3-(cyclohex-1-en-1-yl)-1-phenylpropan-1-one 77 in $23 \%$ isolated yield ( $14 \mathrm{mg}, 0.07 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.95(\mathrm{t}, J=7.13 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.55(\mathrm{t}, J=7.43 \mathrm{~Hz}, 1 \mathrm{H}), 7.46(\mathrm{t}, J=7.89 \mathrm{~Hz}, 2 \mathrm{H}), 5.45-5.44(\mathrm{~m}, 1 \mathrm{H}), 3.08-3.05(\mathrm{~m}$, $2 \mathrm{H}), 2.36(\mathrm{t}, J=7.53 \mathrm{~Hz}, 2 \mathrm{H}), 2.00-1.96(\mathrm{~m}, 4 \mathrm{H}), 1.65-1.61(\mathrm{~m}, 2 \mathrm{H}), 1.57-1.53(\mathrm{~m}$, $2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 200.80(\mathrm{~s}), 137.70(\mathrm{~s}), 137,18$ (s), 133.53 (s),
 (s).

## Cyclohex-1-en-1-ylmethyl acetate

To an ice-cooled solution of cyclohex-1-en-1-ylmethanol (1.65 g, $14.68 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{ml})$ were added $\mathrm{Et}_{3} \mathrm{~N}(4.10 \mathrm{ml}, 29.4 \mathrm{mmol})$ and a solution of $N, N$-dimethylpyridin-4-amine ( $18 \mathrm{mg}, 0.15 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(7 \mathrm{ml})$. After 2 min , acetyl chloride ( $1.26 \mathrm{ml}, 17.62 \mathrm{mmol}$ ) was added dropwise and the reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 1.5 h . The ice-bath was removed and the solution was stirred for an additional 30 min at $25^{\circ} \mathrm{C}$. Then, it was quenched with cold $5 \% \mathrm{HCl}(80 \mathrm{ml})$ and the phases were separated. The organic layers were washed with water, saturated $\mathrm{NaHCO}_{3}$ and brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. Cyclohex-1-en-1-ylmethyl acetate was obtained in quantitative yield ( 2.26 g , $14.67 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 5.74($ broad s, 1 H$), 4.43(\mathrm{~s}, 2 \mathrm{H}), 2.07(\mathrm{~s}$, $3 \mathrm{H}), 2.06-2.02(\mathrm{~m}, 2 \mathrm{H}), 2.00-1.97(\mathrm{~m}, 2 \mathrm{H}), 1.68-1.62(\mathrm{~m}, 2 \mathrm{H}), 1.61-1.56(\mathrm{~m}, 2 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 171.99$ (s), 133.72 (s), 127.38 (s), 69.83 (s), 26.77 (s), 25.86 (s), 23.24 (s), 22.95 (s), 21.90 (s).

## 2-(2-Methylenecyclohexyl)acetic acid

Lithium diisopropylamide ( $3.14 \mathrm{~g}, 29.3 \mathrm{mmol}$ ) was dissolved in THF ( 45 ml )and cooled down to $-78^{\circ} \mathrm{C}$. Cyclohex-1-en-1-ylmethyl acetate (2.26 $\mathrm{g}, 14.67 \mathrm{mmol})$ in THF ( 4.5 ml ) was added over 5 min . After 10 min , chlorotrimethylsilane ( $4.15 \mathrm{ml}, 32.3 \mathrm{mmol}$ ) was added in one portion and, 2 min later, the solution was warmed up to $25^{\circ} \mathrm{C}$. The reaction mixture was heated to reflux for 2.5 h and cooled down again to $25^{\circ} \mathrm{C}$. Methanol ( 15 ml ) was added and the solution was stirred for an additional 15 min . Then, it was quenched with aqueous $5 \%$ $\mathrm{NaOH}(250 \mathrm{ml})$ and washed with diethyl ether. The aqueous layer was cooled down to 0 ${ }^{\circ} \mathrm{C}$, acidified with concentrated HCl and extracted five times with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layers were collected, washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. 2-(2Methylenecyclohexyl)acetic acid was obtained in $53 \%$ isolated yield ( $1.21 \mathrm{~g}, 7.84 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 4.69($ broad s, 1 H$), 4.56(\operatorname{broad~s}, 1 \mathrm{H}), 2.64(\mathrm{dd}, J=$ $15.10,6.33 \mathrm{~Hz}, 1 \mathrm{H}), 2.58-2.52(\mathrm{~m}, 1 \mathrm{H}), 2.34(\mathrm{dd}, J=15.10,8.03 \mathrm{~Hz}, 1 \mathrm{H}), 2.31-2.27$ $(\mathrm{m}, 1 \mathrm{H}), 2.08-2.03(\mathrm{~m}, 1 \mathrm{H}), 1.87-1.82(\mathrm{~m}, 1 \mathrm{H}), 1.74-1.69(\mathrm{~m}, 2 \mathrm{H}), 1.53-1.46(\mathrm{~m}$, $1 \mathrm{H}), 1.45-1.37(\mathrm{~m}, 1 \mathrm{H}), 1.24-1.17(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, CDCl $\left.{ }_{3}, \mathrm{ppm}\right) \delta$ 179.82 (s), 151.61 (s), 105.89 (s), 39.97 (s), 38.21 (s), 35.96 (s), 34.45 (s), 28.83 (s), 25.43 (s).

## 1-(2-Methylenecyclohexyl)propan-2-one (78)

A stirred solution of 2-(2-methylenecyclohexyl)acetic acid ( $0.40 \mathrm{~g}, 2.59$ mmol ) in THF ( 26 ml ) was cooled down to $0{ }^{\circ} \mathrm{C}$ and treated rapidly with methyllithium 1.6 M in diethyl ether ( $13 \mathrm{ml}, 20.75 \mathrm{mmol}$ ). The reaction mixture was stirred for 2 h and chlorotrimethylsilane $(6.58 \mathrm{ml}, 51.90$ $\mathrm{mmol})$ was added. The solution was warmed up to $25^{\circ} \mathrm{C}$ and quenched with $1 \mathrm{M} \mathrm{HCl}(70$
$\mathrm{ml})$. The phases were stirred at $25{ }^{\circ} \mathrm{C}$ for 1 h and separated. The aqueous phase was extracted with diethyl ether and the combined organic layers were washed with water, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The residue was purified with silica gel column chromatography using cyclohexane:ethyl acetate (20:1) to obtain 1-(2-methylenecyclohexyl)propan-2-one 78 in $55 \%$ isolated yield ( $0.22 \mathrm{~g}, 1.43 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 4.65$ (broad s, 1 H ), 4.45 (broad s, 1 H$), 2.69$ (dd, $J=15.97,6.52$ $\mathrm{Hz}, 1 \mathrm{H}), 2.62-2.55(\mathrm{~m}, 1 \mathrm{H}), 2.39(\mathrm{dd}, J=16.20,7.20 \mathrm{~Hz}, 1 \mathrm{H}), 2.30-2.25(\mathrm{~m}, 1 \mathrm{H}), 2.15$ $(\mathrm{s}, 3 \mathrm{H}), 2.09-2.01(\mathrm{~m}, 1 \mathrm{H}), 1.78-1.65(\mathrm{~m}, 3 \mathrm{H}), 1.53-1.46(\mathrm{~m}, 1 \mathrm{H}), 1.44-1.36(\mathrm{~m}, 1 \mathrm{H}$, $1.17-1.09(\mathrm{~m}, 1 \mathrm{H})$.

## 3-Methyl-1-(2-methylenecyclohexyl)butan-2-one (79)

A stirred solution of 2-(2-methylenecyclohexyl)acetic acid ( $0.25 \mathrm{~g}, 1.62$ mmol ) in THF ( 16 ml ) was cooled down to $0^{\circ} \mathrm{C}$ and treated rapidly with isopropyllithium 0.7 M in pentane ( $46 \mathrm{ml}, 32.40 \mathrm{mmol}$ ). The reaction mixture was stirred for 2 h and chlorotrimethylsilane $(8.23 \mathrm{ml}, 64.81$ $\mathrm{mmol})$ was added. The solution was warmed up to $25^{\circ} \mathrm{C}$ and quenched with $1 \mathrm{M} \mathrm{HCl}(80$ ml ). The phases were stirred at $25{ }^{\circ} \mathrm{C}$ for 1 h and separated. The aqueous phase was extracted with diethyl ether and the combined organic layers were washed with water, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The residue was purified with silica gel column chromatography using cyclohexane:ethyl acetate (40:1) to obtain 3-methyl-1-(2-methylenecyclohexyl)butan-2-one 79 in $37 \%$ isolated yield ( $0.11 \mathrm{~g}, 0.60 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 4.66(\mathrm{~s}, 1 \mathrm{H}), 4.48(\mathrm{~s}, 1 \mathrm{H}), 2.71(\mathrm{dd}, J=16.03,5.84 \mathrm{~Hz}, 1 \mathrm{H})$, $2.67-2.61(\mathrm{~m}, 2 \mathrm{H}), 2.48(\mathrm{dd}, J=16.03,7.34 \mathrm{~Hz}, 1 \mathrm{H}), 2.32-2.28(\mathrm{~m}, 1 \mathrm{H}), 2.11-2.06$ $(\mathrm{m}, 1 \mathrm{H}), 1.76-1.69(\mathrm{~m}, 3 \mathrm{H}), 1.51-1.47(\mathrm{~m}, 1 \mathrm{H}), 1.43-1.39(\mathrm{~m}, 1 \mathrm{H}), 1.17-1.13(\mathrm{~m}$, $1 \mathrm{H}), 1.11(\mathrm{~d}, J=6.90 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 214.09(\mathrm{~s}), 152.20(\mathrm{~s})$, 105.15 (s), 43.77 (s), 41.33 (s), 38.65 (s), 35.84 (s), 34.36 (s), 28.72 (s), 25.28 (s), 18.41 (s), $18.26(\mathrm{~s}) . \mathrm{ESI}^{+} m / z$ calc for $\mathrm{C}_{12} \mathrm{H}_{20} \mathrm{NaO}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$203.1406, found 203.1408 (0.2 $\mathrm{ppm})$.

## General Procedure for the Preparation of Oxabicycles

To a solution of the oxoalkene ( 1 equiv.) and the arylalkyne ( 3.5 equiv.) in DCE ( 0.5 M ), the cationic gold (I) catalyst $\mathbf{A}(5 \mathrm{~mol} \%)$ was added. Then, the reaction mixture was stirred at $50^{\circ} \mathrm{C}$ and followed by TLC. When it was finished, the catalyst was quenched by adding 0.05 ml of $\mathrm{Et}_{3} \mathrm{~N}$, the solvent was removed and the crude was analysed by quantitative ${ }^{1} \mathrm{H}$ NMR using 1,4-diacetylbenzene as internal standard. Finally, the oxabicycle product was purified by preparative TLC and fully characterized.

## 1,5-Dimethyl-3-phenyl-8-oxabicyclo[3.2.1]oct-2-ene (23)

Compound 23 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mu \mathrm{l}, 0.2 \mathrm{mmol}$ ) and ethynylbenzene ( $77.0 \mu \mathrm{l}, 0.7 \mathrm{mmol}$ ) with catalyst $\mathbf{A}(9.0 \mathrm{mg}, 0.01 \mathrm{mmol})$. The reaction time was 19 h and pure $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was used as eluent in the separation to obtain pure 1,5-dimethyl-3-phenyl-8-oxabicyclo[3.2.1]oct-3-ene as a yellow oil in $68 \%$ isolated yield ( $29.1 \mathrm{mg}, 0.14 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.38(\mathrm{~d}, J=$ $8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.28-7.19(\mathrm{~m}, 1 \mathrm{H}), 6.22(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.70(\mathrm{~d}$, $J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.28(\mathrm{dd}, J=16.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.11-2.04(\mathrm{~m}, 1 \mathrm{H}), 1.96-1.85(\mathrm{~m}$, $1 \mathrm{H}), 1.84-1.78(\mathrm{~m}, 2 \mathrm{H}), 1.50(\mathrm{~s}, 3 \mathrm{H}), 1.49(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$
139.93 (s), 133.61 (s), 131.09 (s), 128.46 (s), 127.44 (s), 125.01 (s), 79.73 (s), 79.49 (s), 42.34 (s), 42.21 (s), 37.53 (s), 27.42 (s), 23.78 (s). Structure confirmed by ${ }^{1}$ H COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$215.1436, found 215.1438 ( 0.9 ppm ).

1,5-Dimethyl-3-(naphthalen-2-yl)-8-oxabicyclo[3.2.1]oct-2-ene (26)

Compound 26 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mu \mathrm{l}, 0.2 \mathrm{mmol}$ ) and 2ethynylnaphthalene ( $107.0 \mathrm{mg}, 0.7 \mathrm{mmol}$ ) with catalyst $\mathbf{A}(9.0 \mathrm{mg}$, $0.01 \mathrm{mmol})$. The reaction time was 20 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:99) was used as eluent in the separation to obtain pure 1,5-dimethyl-3-(naphthalen-2-yl)-8-oxabicyclo[3.2.1]oct-3-ene as a yellowish powder in $62 \%$ isolated yield $(32.5 \mathrm{mg}, 0.12 \mathrm{mmol})$. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.84-7.72(\mathrm{~m}, 4 \mathrm{H}), 7.60(\mathrm{dd}, J=8.6,1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.50-7.37(\mathrm{~m}, 2 \mathrm{H})$, $6.39(\mathrm{t}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.81(\mathrm{~d}, J=16.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.43(\mathrm{dd}, J=16.6,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.13-$ $2.08(\mathrm{~m}, 1 \mathrm{H}), 2.00-1.90(\mathrm{~m}, 1 \mathrm{H}), 1.88-1.82(\mathrm{~m}, 2 \mathrm{H}), 1.55(\mathrm{~s}, 3 \mathrm{H}), 1.53(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 137.06$ (s), 133.59 (s), 133.38 (s), 132.91 (s), 131.70 (s), 128.23 (s), 127.93 (s), 127.65 (s), 126.29 (s) 125.88 ( s$), 123.55$ ( s$), 123.43$ (s), 79.83 (s), 79.55 (s), 42.33 (s), 42.19 (s), 37.56 (s), 27.48 (s), 23.85 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{OCl}^{+}[\mathrm{M}+\mathrm{H}]^{+}$ 249.1046, found 249.1041 ( -2.0 ppm ).

1,5-Dimethyl-8-oxabicyclo[3.2.1]oct-2-en-3-yl)phenol (33)

Compound 33 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mu \mathrm{l}, 0.2 \mathrm{mmol}$ ) and 3-ethynylphenol $(76.0 \mu 1,0.7 \mathrm{mmol})$ with catalyst $\mathbf{A}(9.0 \mathrm{mg}, 0.01 \mathrm{mmol})$. The reaction time was 37 h and a mixture of cyclohexane and ethyl acetate (2:1) was used as eluent in the separation to obtain pure 3-(1,5-dimethyl-8-oxabicyclo[3.2.1]oct-3-en-3-yl)phenol as a yellowish powder in $65 \%$ isolated yield ( $22.8 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). Moreover, this compound was synthesized in larger scale. To a solution of 5-methylhex-5-en-2-one ( $0.26 \mathrm{ml}, 2.00 \mathrm{mmol}$ ) and 3-ethynylphenol ( $1.0 \mathrm{~g}, 8.50 \mathrm{mmol}$ ) in DCE $(5.6 \mathrm{ml})$ at $25^{\circ} \mathrm{C}$, the cationic gold (I) catalyst $(75.0 \mathrm{mg}, 4 \mathrm{~mol} \%)$ was added. Then, the reaction mixture was stirred at $50^{\circ} \mathrm{C}$ for 39 h and followed by TLC. When it was finished, it was quenched by adding 0.5 ml of $\mathrm{Et}_{3} \mathrm{~N}$ and the solvent was removed. Finally, the crude was purified by column chromatography using a mixture of cyclohexane and ethyl acetate (9:1) as eluent in the separation to obtain pure 3-(1,5-dimethyl-8-oxabicyclo[3.2.1]oct-3-en-3-yl)phenol as a yellowish powder in $74 \%$ isolated yield ( $339.2 \mathrm{mg}, 1.47 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CD}_{3} \mathrm{OD}, \mathrm{ppm}\right) \delta 7.12(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.88(\mathrm{ddd}, J=7.8,1.8,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.83(\mathrm{t}, J=$ $2.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.69$ (ddd, $J=8.0,2.5,0.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.21(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.59(\mathrm{~d}, J=16.8$ $\mathrm{Hz}, 1 \mathrm{H}), 2.31(\mathrm{~d}, J=16.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.11-2.04(\mathrm{~m}, 1 \mathrm{H}), 1.97-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.87-1.73$ $(\mathrm{m}, 2 \mathrm{H}), 1.46(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}, \mathrm{ppm}\right) \delta 158.44(\mathrm{~s})$, 142.44 (s), 134.95 (s), 131.23 (s), 130.35 (s), 117.34 (s), 115.38 (s), 112.75 (s), 81.22 (s), 81.04 (s), 43.10 (s), 42.95 (s), 38.08 (s), 27.41 (s), 23.78 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}^{-13} \mathrm{C}$ HMQC NMR. ESI $\mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{O}_{2}{ }^{-}[\mathrm{M}-\mathrm{H}]^{-}$229.1229,
found $229.1223(-2.6 \mathrm{ppm})$. Mp $129.8-130.5{ }^{\circ} \mathrm{C}$. Structure confirmed by X-Ray crystallography, CCDC 913001.

## 3-(3-Methoxyphenyl)-1,5-dimethyl-8-oxabicyclo[3.2.1]oct-2-ene (34)

Compound 34 was synthesized following the general procedure starting from 5 -methylhex-5-en-2-one ( $26.0 \mu \mathrm{l}, 0.2 \mathrm{mmol}$ ) and 1-ethynyl-3-methoxybenzene $(89.0 \mu \mathrm{l}, 0.7 \mathrm{mmol})$ with catalyst $\mathbf{A}(9.0$ $\mathrm{mg}, 0.01 \mathrm{mmol})$. The reaction time was 19 h and pure $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was used as eluent in the separation to obtain pure 3-(3-methoxyphenyl)-1,5-dimethyl-8-oxabicyclo[3.2.1]oct-3-ene as a yellow oil in 91\% isolated yield ( $44.6 \mathrm{mg}, 0.18 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 7.26-7.20(\mathrm{~m}, 1 \mathrm{H}), 7.01-6.96(\mathrm{~m}, 1 \mathrm{H}), 6.91(\mathrm{t}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.84-6.77(\mathrm{~m}$, $1 \mathrm{H}), 6.22(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.81$ (s, 3H), 2.68 (d, $J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.26$ (dd, $J=16.7,1.2$ $\mathrm{Hz}, 1 \mathrm{H}), 2.08-2.04(\mathrm{~m}, 1 \mathrm{H}), 1.93-1.89(\mathrm{~m}, 1 \mathrm{H}), 1.84-1.78(\mathrm{~m}, 2 \mathrm{H}), 1.50(\mathrm{~s}, 3 \mathrm{H}), 1.48$ (s, 3H). ## 3-(4-Bromophenyl)-1-methyl-5-phenyl-8-xabicyclo[3.2.1]oct-2-ene (50)

Compound 50 was synthesized following the general procedure starting from 5 -phenyl-5-hexen-2-one ( $34.5 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and 1-bromo-4-ethynylbenzene ( $125.0 \mathrm{mg}, 0.7 \mathrm{mmol}$ ) with catalyst $\mathbf{A}(9.0$ $\mathrm{mg}, 0.01 \mathrm{mmol})$. The reaction time was 15 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:1) was used as eluent in the separation to obtain pure 3-(4-bromophenyl)-1-methyl-5-phenyl-8oxabicyclo[3.2.1] oct-2-ene as a yellow oil in $70 \%$ isolated yield ( $48.2 \mathrm{mg}, 0.14 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.56(\mathrm{dd}, J=8.3,1.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.47(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H})$, $7.42(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.36-7.28(\mathrm{~m}, 3 \mathrm{H}), 6.37(\mathrm{t}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.89(\mathrm{~d}, J=16.5 \mathrm{~Hz}$, $1 \mathrm{H}), 2.67(\mathrm{~d}, J=17.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.40-2.34(\mathrm{~m}, 1 \mathrm{H}), 2.30-2.12(\mathrm{~m}, 2 \mathrm{H}), 1.93-1.87(\mathrm{~m}$, $1 \mathrm{H}), 1.64(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 147.09(\mathrm{~s}), 138.65(\mathrm{~s}), 132.54$ (s), 131.62 (s), 131.55 (s), 128.42 (s), 126.88 (s), 126.64 (s), 124.40 (s), 121.37 (s), 82.77 (s), 79.83 (s), 43.12 (s), 42.04 (s), 38.75 (s), 23.64 (s). Structure confirmed by ${ }^{1}$ H COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI $\mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{OBr}^{+}[\mathrm{M}+\mathrm{H}]^{+} 355.0698$, found 355.0705 ( 2.0 ppm ).

## 3-(3-fluorophenyl)-1-methyl-5-phenyl-8-xabicyclo[3.2.1]oct-2-ene (51)

Compound $\mathbf{5 1}$ was synthesized following the general procedure starting from 5-phenyl-5-hexen-2-one ( $34.6 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) and 1-ethynyl-3fluorobenzene ( $81.0 \mu \mathrm{l}, 0.7 \mathrm{mmol}$ ) with catalyst $\mathbf{A}(9.0 \mathrm{mg}, 0.01 \mathrm{mmol})$. The reaction time was 20 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:1) was used as eluent in the separation to obtain pure 3-(3-fluorophenyl)-1-methyl-5-phenyl-8-oxabicyclo[3.2.1]oct-2-ene as a yellow oil in 59\% isolated yield ( $34.4 \mathrm{mg}, 0.12 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.51(\mathrm{dd}, J=8.3,1.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.37(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.31-7.22(\mathrm{~m}, 2 \mathrm{H}), 7.17(\mathrm{dt}, J=$ $7.8,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.09(\mathrm{dt}, J=10.7,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.93(\mathrm{td}, J=8.2,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.34(\mathrm{t}, J=$ $1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.86(\mathrm{~d}, J=16.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.63(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.35-2.29(\mathrm{~m}, 1 \mathrm{H}), 2.25$ $-2.08(\mathrm{~m}, 2 \mathrm{H}), 1.89-1.83(\mathrm{~m}, 1 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H})$. ## Procedures for the Derivatization of Oxabicycles

## 3-(1,5-Dimethyl-8-oxabicyclo[3.2.1]octan-3-yl)cyclohexanol (92)

A high pressure steel autoclave was charged with 3-(1,5-dimethyl-8-oxabicyclo[3.2.1]oct-3-en-3-yl)phenol $33(23 \mathrm{mg}, 0.10 \mathrm{mmol})$ in ethanol ( 1.3 ml ) and Ni-Raney ( $0.60 \mathrm{mg}, 0.01 \mathrm{mmol}$ ). The autoclave was pressurized to 80 atm with $\mathrm{H}_{2}$ and the reaction mixture was stirred at $80{ }^{\circ} \mathrm{C}$ for 12 h . Then, the pressure was released slowly and the suspension was filtered though Celite washing with ethanol. The residue was concentrated and purified by silica gel column chromatography using cyclohexane:ethynl acetate (5:1) to obtain 3-(1,5-dimethyl-8-oxabicyclo[3.2.1]octan-3-yl)cyclohexanol 92 in $59 \%$ isolated yield as a mixture of diastereoisomers ( $14 \mathrm{mg}, 0.06 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 3.56-3.49(\mathrm{~m}, 1 \mathrm{H}), 2.11-2.00(\mathrm{~m}, 1.2 \mathrm{H}), 1.97-1.95(\mathrm{~m}, 1.1 \mathrm{H})$, $1.81-1.76(\mathrm{~m}, 2 \mathrm{H}), 1.75-1.67(\mathrm{~m}, 5 \mathrm{H}), 1.66-1.62(\mathrm{~m}, 4.3 \mathrm{H}), 1.55-1.51(\mathrm{~m}, 2.5 \mathrm{H})$, $1.39-1.34(\mathrm{~m}, 1.6 \mathrm{H}), 1.32-1.31(\mathrm{~m}, 4.5 \mathrm{H}), 1.29(\mathrm{~m}, 3 \mathrm{H}), 1.26-1.19(\mathrm{~m}, 0.5 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR for the major diastereoisomer ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 79.08$ (s), 71.20 (s), 40.98 (s), 40.08 ( s ), 39.46 ( s ), 39.15 ( s ), 38.66 ( s$), 38.63$ ( s$), 36.67$ (s), 35.93 (s), 35.31 (s), 30.49 (s), 27.95 (s), 27.07 (s), 24.22 (s). ${ }^{13} \mathrm{C}$ NMR for a minor diastereoisomer ( 126 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 80.45$ (s), 66.82 (s), 42.08 (s), 41.31 (s), 41.20 (s), 39.87 (s), 38.66 (s), 36.70 (s), 35.96 ( s), 35.77 (s), 29.15 (s), 27.99 (s), 27.07 (s), 24.15 (s), 20.18 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR.

3-(1,5-Dimethyl-8-oxabicyclo[3.2.1]octan-3-yl)phenol (93)

3-(1,5-Dimethyl-8-oxabicyclo[3.2.1]oct-3-en-3-yl)phenol 33 (23 mg, $0.10 \mathrm{mmol})$ and $\mathrm{Pd} / \mathrm{C} 10 \%(11 \mathrm{mg}, 0.01 \mathrm{mmol})$ were dissolved in methanol $(1.2 \mathrm{ml})$. The solution was degassed three times with $\mathrm{H}_{2}$ and stirred at 1 atm for 24 h at $25{ }^{\circ} \mathrm{C}$. The reaction mixture was filtered though Teflon 0.22 washing with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and ethyl acetate. The combined filtrates were concentrated and the residue was purified with preparative TLC using cyclohexane:ethyl acetate (2:1) to obtain 3-(1,5-dimethyl-8-oxabicyclo[3.2.1]octan-3-yl)phenol 93 in $95 \%$ isolated yield as a $2: 1$ mixture of diastereoisomers ( $22 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( 400
$\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.18-7.14(\mathrm{~m}, 1 \mathrm{H}), 6.86-6.76(\mathrm{~m}, 2 \mathrm{H}), 6.72-6.67(\mathrm{~m}, 1 \mathrm{H}), 3.10-$ $2.96(\mathrm{~m}, 1 \mathrm{H}), 2.07-2.01(\mathrm{~m}, 1.5 \mathrm{H}), 1.99-1.85(\mathrm{~m}, 0.6 \mathrm{H}), 1.85-1.65(\mathrm{~m}, 6 \mathrm{H}), 1.40-$ $1.38(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR for the major diastereoisomer ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 156.05$ (s), 147.14 ( s), 129.50 (s), 119.09 (s), 114.54 (s), 112.98 (s), 79.50 (s), 42.86 ( s$), 38.68$ (s), 34.87 (s), 27.70 (s). ${ }^{13} \mathrm{C}$ NMR for the minor diastereoisomer ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta$ 156.61 ( s$), 147.20$ (s), 129.78 ( s$), 119.70$ ( s$), 113.74$ (s), 113.58 (s), 81.46 (s), 44.64 (s), 37.37 (s), 36.64 (s), 26.73 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR.

## General Procedure for the Preparation of Tetrahydrofurans

To a solution of the oxoalkene ( 1 equiv.) and the arylalkyne ( 3.5 equiv.) in DCE ( 0.5 M ), p-toluensulphonic acid monohydrate ( $10 \mathrm{~mol} \%$ ) and the cationic gold (I) catalyst $\mathbf{C}$ (3 $\mathrm{mol} \%$ ) were added. Then, the reaction mixture was stirred at $50^{\circ} \mathrm{C}$ and followed by TLC. When it was finished, the catalyst was quenched by adding 0.05 ml of $\mathrm{Et}_{3} \mathrm{~N}$, the solvent was removed and the crude was analysed by quantitative ${ }^{1} \mathrm{H}$ NMR using 1,4diacetylbenzene as internal standard. Finally, the (arylehtynyl)tetrahydrofurane product was purified by Prep-TLC and fully characterized.

## 2,2,5-Trimethyl-5-(phenylethynyl)tetrahydrofuran (37)

Compound 37 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) and ethynylbenzene $(77.0 \mathrm{ml}, 0.7 \mathrm{mmol})$ with $p$-toluensulphonic acid monohydrate ( 3.8 mg , $0.02 \mathrm{mmol})$ and catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 21 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1: 1)$ was used as eluent in the separation to obtain pure 2,2,5-trimethyl-5(phenylethynyl)tetrahydrofuran as a yellow oil in $50 \%$ isolated yield ( $21.3 \mathrm{mg}, 0.10$ mmol). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.44-7.37(\mathrm{~m}, 2 \mathrm{H}), 7.35-7.25(\mathrm{~m}, 3 \mathrm{H}), 2.34$ (ddd, $J=11.7,6.9,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.13$ (ddd, $J=11.6,9.5,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.01$ (ddd, $J=11.8$, $9.6,7.3 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.87 (ddd, $J=11.4,7.2,4.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.61 (s, 3H), 1.43 (s, 3H), 1.26 (s, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 131.68$ (s), 128.29 (s), 128.05 (s), 123.43 (s), 93.93 ( s ), 82.53 ( s$), 82.45(\mathrm{~s}), 76.55(\mathrm{~s}), 40.91(\mathrm{~s}), 39.00(\mathrm{~s}), 29.71(\mathrm{~s}), 29.47(\mathrm{~s}), 29.27(\mathrm{~s})$. Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} m / z$ calc for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$215.1436, found $215.1436(0.0 \mathrm{ppm})$.

## 2-((4-Chlorophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran (38)

Compound 38 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) and 1-chloro-4-ethynylbenzene $(96.0 \mathrm{mg}, \quad 0.7 \mathrm{mmol})$ with $p$ toluensulphonic acid monohydrate $(3.8 \mathrm{mg}, 0.02 \mathrm{mmol})$ and catalyst A $(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 21 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1: 10)$ was used as eluent in the separation to obtain pure 2-((4-chlorophenyl)ethynyl)-2,5,5trimethyltetrahydrofuran as a yellow oil in $48 \%$ isolated yield ( $23.9 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.32(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.25(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.33$ (ddd, $J=11.6,6.7,4.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.11(\mathrm{ddd}, J=11.3,9.3,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.01$ (ddd, $J=11.9$, $9.3,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.87$ (ddd, $J=11.1,7.0,4.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~s}, 3 \mathrm{H}), 1.25(\mathrm{~s}$,
$3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 134.06$ (s), 132.92 (s), 128.62 (s), 121.93 (s), 94.98 ( s ), 82.59 ( s ), 81.35 ( s ), 76.47 ( s$), 40.83$ ( s$), 38.98$ ( s$), 29.69$ ( s$), 29.45$ ( s$), 29.26$ (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}_{-}^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} \mathrm{m} / z$ calc for $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{Cl}^{+}[\mathrm{M}-\mathrm{OH}]^{+}$231.0941, found 231.0940 ( -0.4 ppm ).

## 2-((4-Bromophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran (39)

Compound 39 was synthesized following the general procedure starting from 5 -methylhex-5-en-2-one ( $26.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) and 1-bromo-4-ethynylbenzene ( $127.0 \mathrm{mg}, \quad 0.7 \mathrm{mmol}$ ) with $p$ toluensulphonic acid monohydrate ( $3.8 \mathrm{mg}, 0.02 \mathrm{mmol}$ ) and catalyst A $(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 21 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1: 1)$ was used as eluent in the separation to obtain pure 2-((4-bromophenyl)ethynyl)-2,5,5trimethyltetrahydrofuran as yellow oil in $50 \%$ isolated yield ( $29.4 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.44(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.28(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.41-$ $2.31(\mathrm{~m}, 1 \mathrm{H}), 2.13(\mathrm{ddd}, J=11.3,9.3,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.04(\mathrm{ddd}, J=11.8,9.3,7.0 \mathrm{~Hz}, 1 \mathrm{H})$, 1.89 (ddd, $J=11.1,7.0,4.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.43(\mathrm{~s}, 3 \mathrm{H}), 1.28(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 133.15$ (s), 131.56 (s), 122.40 (s), 122.26 (s), 95.18 (s), 82.60 (s), 81.42 (s), 76.49 (s), 40.81 (s), 38.98 (s), 29.69 (s), 29.45 (s), 29.24 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}_{-}{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} m / z$ calc for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{OBr}^{+}$ $[\mathrm{M}+\mathrm{H}]^{+} 293.0541$, found $293.0555(-0.4 \mathrm{ppm})$.

## 2-((3-Fluorophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran (40)

Compound 40 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) and 1-ethynyl-3-fluorobenzene ( $81.0 \mathrm{ml}, 0.7 \mathrm{mmol}$ ) with $p$-toluensulphonic acid monohydrate $(3.8 \mathrm{mg}, 0.02 \mathrm{mmol})$ and catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006$ $\mathrm{mmol})$. The reaction time was 21 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:2) was used as eluent in the separation to obtain pure 2-((3-fluorophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran as a yellow oil in $47 \%$ isolated yield ( $21.8 \mathrm{mg}, 0.09 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 7.24(\mathrm{td}, J=7.9,5.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.18(\mathrm{dt}, J=7.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.09$ (ddd, $J=9.6,2.5$, $1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.99(\mathrm{tdd}, J=8.5,2.6,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.40-2.26(\mathrm{~m}, 1 \mathrm{H}), 2.12(\mathrm{ddd}, J=11.3$, $9.4,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.02(\mathrm{ddd}, J=11.8,9.4,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.88$ (ddd, $J=11.1,7.0,4.1 \mathrm{~Hz}$, $1 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 163.44$ $\left(\mathrm{d}, J\left({ }^{13} \mathrm{C}^{-19} \mathrm{~F}\right)=246.9 \mathrm{~Hz}, 129.84\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=7.9 \mathrm{~Hz}\right), 127.56\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=3.1\right.\right.$ $\mathrm{Hz}), 125.28\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=9.4 \mathrm{~Hz}\right), 118.48\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=22.1 \mathrm{~Hz}\right), 115.40\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-\right.\right.$ $\left.\left.{ }^{19} \mathrm{~F}\right)=20.4 \mathrm{~Hz}\right), 94.98(\mathrm{~s}), 82.62(\mathrm{~s}), 81.28\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=3.6 \mathrm{~Hz}\right), 76.43(\mathrm{~s}), 40.83(\mathrm{~s})$, 38.97 (s), 29.68 (s), 29.45 (s), 29.21 (s). ${ }^{19}$ F NMR ( $376 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta-113.42$ (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+} m / z$ calc for $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{~F}^{+}[\mathrm{M}-\mathrm{OH}]^{+}$215.1236, found 215.1237 ( 0.5 ppm ).

## 2-((3-Chlorophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran (41)

Compound 41 was synthesized following the general procedure starting from 5-methylhex-5-en-2-one ( $26.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) and 1-chloro-3-ethynylbenzene ( $86.0 \mathrm{ml}, 0.7 \mathrm{mmol}$ ) with $p$-toluensulphonic acid monohydrate $(3.8 \mathrm{mg}, 0.02 \mathrm{mmol})$ and catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006$ $\mathrm{mmol})$. The reaction time was 21 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (1:2) was used as eluent in the separation to obtain pure 2-((3-chlorophenyl)ethynyl)-2,5,5-trimethyltetrahydrofuran as a yellowish doughy powder in $55 \%$ isolated yield ( $27.3 \mathrm{mg}, 0.11 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 7.39(\mathrm{t}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.30-7.24(\mathrm{~m}, 2 \mathrm{H}), 7.24-7.16(\mathrm{~m}, 1 \mathrm{H}), 2.33(\mathrm{ddd}, J=$ $11.7,6.7,4.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.11$ (ddd, $J=11.3,9.4,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.02$ (ddd, $J=11.9,9.4,7.0$ $\mathrm{Hz}, 1 \mathrm{H}), 1.87(\mathrm{ddd}, J=11.1,7.0,4.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 134.12$ ( s ), 131.56 ( s ), 129.83 ( s$), 129.53$ ( s ), 128.36 ( s ), 125.14 (s), 95.28 (s), 82.63 (s), 81.09 (s), 76.42 (s), 40.83 (s), 38.97 (s), 29.68 (s), 29.46 (s), 29.20 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. APCI ${ }^{+}$ $m / z$ calc for $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{Cl}^{+}[\mathrm{M}-\mathrm{OH}]^{+}$231.0941, found 231.0941 ( 0.0 ppm ).

## General Procedure for the Preparation of 1,3,5-Substituted Benzenes

To a solution of the arylalkyne ( 0.20 mmol ) in DCE ( 2 M ), the cationic gold (I) catalyst $\mathbf{C}$ ( $3 \mathrm{~mol} \%$ ) was added. Then, the reaction mixture was stirred at $50^{\circ} \mathrm{C}$ and followed by TLC. When it was finished, the catalyst was quenched by adding 0.02 ml of $\mathrm{Et}_{3} \mathrm{~N}$, the solvent was removed and the crude was analysed by quantitative ${ }^{1} \mathrm{H}$ NMR using 1,4 diacetylbenzene as internal standard. Finally, the 1,3,5-triarylbenzene product was purified by preparative TLC and fully characterized.

## 5'-Phenyl-1,1':3',1'-terphenyl (24)

Compound 24 was synthesized following the general procedure starting from ethynylbenzene ( $22.0 \mathrm{ml}, 0.2 \mathrm{mmol}$ ) with catalyst A $(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 16 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3:1) was used as eluent in the separation to obtain pure $5^{\prime}$-phenyl-1, $1^{\prime}: 3^{\prime}, 1$ "-terphenyl as a yellow oil in $40 \%$ isolated yield ( $8.0 \mathrm{mg}, 0.03 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta 7.79(\mathrm{~s}, 3 \mathrm{H}), 7.70(\mathrm{dd}, J=8.3,1.2 \mathrm{~Hz}, 6 \mathrm{H}), 7.48(\mathrm{t}, J=7.5$ $\mathrm{Hz}, 6 \mathrm{H}), 7.43-7.36(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 142.50(\mathrm{~s}), 141.31(\mathrm{~s})$, 129.00 (s), 127.69 (s), 127.51 (s), 125.33 (s). Structure confirmed by ${ }^{1}$ H COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR.

## 4,4"-Dimethyl-5'-(p-tolyl)-1,1':3',1'-terphenyl (112)

Compound 113 was synthesized following the general procedure starting from 1-ethynyl-4-methylbenzene $(25.4 \mathrm{ml}$, 0.2 mmol ) with catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 16 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3:1) was used as eluent in the separation to obtain pure 4,4"-dimethyl-5'-( $p$-tolyl)-1,1':3',1"-terphenyl as a yellow oil in $33 \%$ isolated yield ( $7.6 \mathrm{mg}, 0.02 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.73(\mathrm{~s}, 3 \mathrm{H}), 7.59(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 6 \mathrm{H}), 7.28(\mathrm{~d}$,
$J=7.9 \mathrm{~Hz}, 6 \mathrm{H}), 2.42(\mathrm{~s}, 9 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 142.31(\mathrm{~s}), 138.55(\mathrm{~s})$, 137.41 (s), 129.68 (s), 127.33 (s), 124.72 (s), 21.29 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}^{13}{ }^{13} \mathrm{C}$ HMQC NMR.

4,4'-Difluoro-5'-(4-fluorophenyl)-1,1':3',1'-terphenyl (113)

Compound 114 was synthesized following the general procedure starting from 1-ethynyl-4-fluorobenzene ( $22.9 \mathrm{ml}, 0.2$ $\mathrm{mmol})$ with catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 16 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3: 1)$ was used as eluent in the separation to obtain pure 4,4"-difluoro-5'-(4-fluorophenyl)-1, $1^{\prime}: 3^{\prime}, 1^{\prime \prime}$-terphenyl as a yellow oil in $37 \%$ isolated yield ( $8.8 \mathrm{mg}, 0.02 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 7.66(\mathrm{~s}, 3 \mathrm{H}), 7.66-7.61(\mathrm{~m}, 6 \mathrm{H}), 7.17(\mathrm{t}, J=8.7 \mathrm{~Hz}$, $6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 162.84\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)\right.$ $=246.83 \mathrm{~Hz}), 141.69(\mathrm{~s}), 137.16\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=3.41 \mathrm{~Hz}\right), 129.05\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=7.97\right.$ $\mathrm{Hz}), 125.01(\mathrm{~s}), 115.98\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=21.37 \mathrm{~Hz}\right) .{ }^{19} \mathrm{~F}$ NMR $\left(376 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta-$ 115.15 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR.

3,3'-Dimethyl-5'-(m-tolyl)-1,1':3',1'-terphenyl (114)

Compound 115 was synthesized following the general procedure starting from 1-ethynyl-3-methylbenzene $(26.0 \mathrm{ml}$, $0.2 \mathrm{mmol})$ with catalyst $\mathbf{A}(5.4 \mathrm{mg}, 0.006 \mathrm{mmol})$. The reaction time was 16 h and a mixture of pentane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3: 1)$ was used as eluent in the separation to obtain pure 3,3"-dimethyl-5'( $m$-tolyl)-1, $1^{\prime}: 3^{\prime}, 1$ "-terphenyl as a yellowish doughy powder in $20 \%$ isolated yield ( $4.5 \mathrm{mg}, 0.01 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.75(\mathrm{~s}, 3 \mathrm{H}), 7.54-7.47(\mathrm{~m}, 6 \mathrm{H}), 7.37(\mathrm{t}, J$ $=8.0 \mathrm{~Hz}, 3 \mathrm{H}), 7.20(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 3 \mathrm{H}), 2.45(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR
$\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 142.49$ (s), 141.38 (s), 138.58 (s), 128.88 (s), 128.38 (s), 128.30 (s), 125.27 (s), 124.61 (s), 21.72 (s). Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR.

# 3. Mechanistic Study of A [2+2+2] Cycloaddition: Role of Digold Complexes ${ }^{1}$ 

## Preparation of the Starting Materials

All the substrates and gold complexes used were already described in Chapter 2 except for the following.

## Deuterated para-bromoethynylbenzene

A flame-dried flask was charged with $p$-bromoethynylbenzene ( 0.47 $\mathrm{g}, 2.58 \mathrm{mmol})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(0.60 \mathrm{~g}, 3.87 \mathrm{mmol})$ in acetonitrile ( 5 ml ). The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere for 45 min . Then, deuterated water ( 2 ml ) was added and the solution was stirred for 1 h . The crude was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the phases were separated. The organic layers were dried with MgSO 4 , filtered and concentrated under reduced pressure. Deuterated $p$ bromoethynylbenzene was obtained [D] $96 \%$ in $72 \%$ isolated yield ( $0.34 \mathrm{~g}, 1.85 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.46(\mathrm{~d}, J=8.58 \mathrm{~Hz}, 2 \mathrm{H}), 7.35(\mathrm{~d}, J=8.53 \mathrm{~Hz}, 2 \mathrm{H})$, $3.13(\mathrm{~s}, 0.04 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 133.6$ (s), 131.7 (s), 123.2 (s), 121.1 $(\mathrm{s}), 82.3\left(\mathrm{t}, J\left({ }^{2} \mathrm{H}{ }^{13} \mathrm{C}\right)=7.60 \mathrm{~Hz}\right), 78.2\left(\mathrm{t}, J\left({ }^{2} \mathrm{H}-{ }^{13} \mathrm{C}\right)=38.58 \mathrm{~Hz}\right)$.
\{Phenylethynyl[(2',4',6'-triisopropyl-1,1'-biphenyl-2-yl)di-tert-butylphosphinelgold(I) [(2',4',6'-triisopropyl-1,1'-biphenyl-2-yl)di-tert-butylphosphine]gold(I) hexafluoroantimonate (67)

Ethynylbenzene ( $61.5 \mu \mathrm{l}, 0.56 \mathrm{mmol}$ ) was dissolved in THF ( 10 ml ) and the solution was cooled to $0^{\circ} \mathrm{C}$. Then, LiHMDS ( $110 \mathrm{mg}, 0.67 \mathrm{mmol}$ ) was added and the solution was stirred for 30 min . Afterwards, 1 ml of this stock solution was added to chloro[( $2^{\prime}, 4^{\prime}, 6^{\prime}$-triisopropyl-1,1'-biphenyl-2-yl)di-tert-butylphosphine]gold(I) (50 $\mathrm{mg}, 0.06 \mathrm{mmol})$ dissolved in THF $(1 \mathrm{ml})$. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 12 h . The solution was concentrated under vacuum and the residue was added to a solution of chloro[(2', $4^{\prime}, 6^{\prime}$-triisopropyl-1, $1^{\prime}$-biphenyl-2-yl)di-tert-butylphosphine]gold(I) ( $40 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml})$. Then, $\mathrm{AgSbF}_{6}(21 \mathrm{mg}, 0.06 \mathrm{mmol})$ was added and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 5 min and afterwards filtered through celite. The solution was concentrated under reduced pressure to 1 ml approximately and the residue was diluted with pentane ( 6 ml ) and cooled to $6^{\circ} \mathrm{C}$ for 12 h . The precipitate was washed with pentane and pure \{phenylethynyl[( $2^{\prime}, 4^{\prime}, 6^{\prime}$-triisopropyl-1, $1^{\prime}$-biphenyl-2-yl)di-tert-butylphosphine]gold(I)\}
[( $2^{\prime}, 4^{\prime}, 6^{\prime}$-triisopropyl-1, $1^{\prime}$-biphenyl-2-yl)di-tertbutylphosphine]gold(I) hexafluoroantimonate (67) was obtained as a white powder in $99 \%$ isolated yield ( $87.0 \mathrm{mg}, 0.06 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 7.95-7.86(\mathrm{~m}$, $2 \mathrm{H}), 7.56-7.53(\mathrm{~m}, 4 \mathrm{H}), 7.43-7.36(\mathrm{~m}, 2 \mathrm{H}), 7.32-7.30(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.22(\mathrm{~m}, 2 \mathrm{H})$, $6.84(\mathrm{~s}, 4 \mathrm{H}), 2.37-2.30(\mathrm{~m}, 6 \mathrm{H}), 1.44(\mathrm{~d}, J=15.6 \mathrm{~Hz}, 36 \mathrm{H}), 1.15(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 12 \mathrm{H})$, $1.08(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 12 \mathrm{H}), 0.85(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 12 \mathrm{H}){ }^{13} \mathrm{C} \mathrm{NMR}\left(101 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta$ $149.9(\mathrm{~s}), 148.0\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=14.2 \mathrm{~Hz}\right), 147.1(\mathrm{~s}), 136.2\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=5.9 \mathrm{~Hz}\right), 135.5$

[^101]$\left(\mathrm{d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=2.9 \mathrm{~Hz}\right), 135.4\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=8.6 \mathrm{~Hz}\right), 133.1(\mathrm{~s}), 131.3(\mathrm{~s}), 130.5(\mathrm{~s})$, $128.9(\mathrm{~s}), 127.9(\mathrm{~s}), 127.6(\mathrm{~s}), 127.5\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=4.9 \mathrm{~Hz}\right), 122.2(\mathrm{~s}), 122.1(\mathrm{~s}), 121.3$ (s), $39.3\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=24.6 \mathrm{~Hz}\right.$ ), $33.9(\mathrm{~s}), 31.8\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=6.8 \mathrm{~Hz}\right), 31.3(\mathrm{~s}), 26.3$ (s), 24.2 (s), 23.6 (s). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}$ ) $\delta 65.17 .{ }^{19} \mathrm{~F}$ NMR ( 376 MHz , $\mathrm{CD}_{2} \mathrm{Cl}_{2}$, ppm) $\delta$ not conclusive. Structure confirmed by ${ }^{1} \mathrm{H}$ COSY NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR. MALDI ${ }^{+} m / z$ calc for $\mathrm{C}_{66} \mathrm{H}_{95} \mathrm{Au}_{2} \mathrm{P}_{2}{ }^{+}\left[\mathrm{M}_{-} \mathrm{SbF}_{6}\right]^{+} 1343.6235$, found 1343.6238 ( 0.3 ppm ). Structure confirmed by X-Ray crystallography, CCDC 913002.

## 4. Anion Effects in Gold-Catalyzed Intermolecular Cycloadditions ${ }^{1}$

All the reactants, ligands and the following reagents were purchased from commercial sources and used without further purification: ethynylbenzene, 1-ethynyl-4-fluorobenzene, 1-ethynyl-4-chlorobenzene, 1-ethynyl-4-bromobenzene, 1-ethynyl-3-methylbenzene, 1-ethynyl-3-fluorobenzene, 1-ethynyl-3-chlorobenzene, 3-ethynylphenol, 1-ethynyl-3methoxybenzene, 1-ethynyl-2-methylbenzene, 3-ethynylthiophene, 1-ethynyl-4nitrobenzene, ethynylcyclopropane, 1-ethynyl-4-methoxybenzene, 1-ethynyl-4methylbenzene, 1-ethynyl-2-methoxybenzene, 1-ethynyl-2-bromobenzene, ethynyltrimethylsilane, 2-methylbut-1-en-3-yne, hex-3-yne, prop-1-yn-1-ylbenzene, 1,2diphenylethyne, , $\alpha$-methylstyrene, 2,5-dimethylfuran, 5-methylhex-5-en-2-one, 2-methylpent-2-ene, methylenecyclohexane, (2-bromoethynyl)benzene, tris(1-methylethyl)-2-propen-1-yl-silane, [(2-methyl-2-propen-1-yl)oxy]benzene, allyltrimethylsilane, indole, 1,3,5-trimethoxybenzene and 1,3-diphenylpropane-1,3-dione. Cyclobutenes 26 and 40 agreed as reported in the literature ${ }^{2}$ as well as phenols $48,{ }^{3}$ enynes 67, 70, 72, 74 and the cyclized polycycles $\mathbf{6 8} / \mathbf{6 9},{ }^{4} \mathbf{7 1},{ }^{5} \mathbf{7 3}{ }^{6}$ and $75 .{ }^{7}$ Gold chlorides with JohnPhos, ${ }^{t}$ BuXPhos, $\mathrm{IPr}, \mathrm{Ph}_{3} \mathrm{P}$ and phosphite 21 were prepared according to the literature. ${ }^{8}$ Catalyst $\mathbf{R}$ was prepared as described. ${ }^{3}$ Enyne 46 and the corresponding macrocycles 47 were characterized in Chapter 1, ${ }^{9}$ oxabicycles 55 in Chapter 2 and digold complex 7 in Chapter 3. ${ }^{10}$

## Preparation of Gold Complexes

(Acetonitrile) [(2',4',6'-triisopropyl-1,1'-biphenyl-2-yl) di-tert-butylphosphine] gold(I) tetrakis[3,5-bis(trifluoromethyl)phenyl] borate (Q)

Chloro $\quad\left[\left(2^{\prime}, 4^{\prime}, 6^{\prime}\right.\right.$-triisopropyl-1,1'-biphenyl-2-yl)di-tert-butylphosphine] $\operatorname{gold}(\mathrm{I})(100.0 \mathrm{mg}, 0.15 \mathrm{mmol})$ and acetonitrile ( $9.5 \mu 1,0.18 \mathrm{mmol}$ ) were dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6.6 \mathrm{ml})$. Then, $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}(135.0 \mathrm{mg}, 0.15 \mathrm{mmol})$ was added and the reaction mixture was

[^102]stirred at $25^{\circ} \mathrm{C}$ for 30 min . The crude was filtered through Celite and concentrated. Finally, it was filtered through Teflon 0.22 and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solvent was removed to afford [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{Q}$ as a white powder in $97 \%$ isolated yield ( 224.3 mg , $0.15 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 7.92-7.85(\mathrm{~m}, 1 \mathrm{H}), 7.75-7.70(\mathrm{~m}$, $8 \mathrm{H}), 7.66-7.58(\mathrm{~m}, 2 \mathrm{H}), 7.56(\mathrm{~s}, 4 \mathrm{H}), 7.32(\mathrm{~m}, 1 \mathrm{H}), 7.16(\mathrm{~s}, 2 \mathrm{H}), 2.94(\mathrm{p}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H})$, 2.33 (dt, $J=13.4,6.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.25(\operatorname{broad} \mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~d}, J=16.3 \mathrm{~Hz}, 18 \mathrm{H}), 1.32(\mathrm{~d}, J=$ 6.9 Hz, 6 H ), $1.25(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 6 \mathrm{H}), 0.93(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 162.3\left(\mathrm{q}, J\left({ }^{13} \mathrm{C}-{ }^{-11} \mathrm{~B}\right)=50.1 \mathrm{~Hz}\right), 150.4(\mathrm{~s}), 148.0(\mathrm{~s}), 147.6\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)\right.$ $=12.8 \mathrm{~Hz}), 136.7\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=6.1 \mathrm{~Hz}\right), 135.5(\mathrm{~s}), 135.4(\mathrm{~s}), 134.7\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=4.6\right.$ $\mathrm{Hz}), 132.1\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{-11} \mathrm{P}\right)=2.6 \mathrm{~Hz}\right), 129.5\left(\mathrm{q}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=28.6 \mathrm{~Hz}\right), 128.1\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=\right.$ $8.1 \mathrm{~Hz}), 126.0\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=50.2 \mathrm{~Hz}\right), 125.2\left(\mathrm{q}, J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=272.3 \mathrm{~Hz}\right), 122.5,118.1(\mathrm{p}$, $\left.J\left({ }^{13} \mathrm{C}-{ }^{19} \mathrm{~F}\right)=4.0 \mathrm{~Hz}\right), 39.2\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=29.3 \mathrm{~Hz}\right), 34.6(\mathrm{~s}), 31.5\left(\mathrm{~d}, J\left({ }^{13} \mathrm{C}-{ }^{31} \mathrm{P}\right)=4.3\right.$ Hz ), 31.5 (s), 26.3 (s), 24.5 (s), 23.4 (s), $3.3(\mathrm{~s}) .{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(162 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta$ 58.68 (s). ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $376 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}$ ) $\delta$-62.97 (s). ${ }^{11} \mathrm{~B}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (128 $\left.\mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta-6.68(\mathrm{~s})$. ## General Procedure for the Preparation of Cyclobutenes ${ }^{11}$

To a solution of the alkyne (1 equiv.) and the alkene (2 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{M})$, the cationic gold (I) catalyst ['BuXPhosAuNCMe]X ( $3 \mathrm{~mol} \%$ ) was added. Then, the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ and followed by TLC. When it was finished, the catalyst was quenched by adding 0.05 ml of $\mathrm{Et}_{3} \mathrm{~N}$, the solvent was removed and the crude was analysed by quantitative ${ }^{1} \mathrm{H}$ NMR using 1,4-diacetylbenzene as internal standard. Finally, the cyclobutene product was purified by preparative TLC and fully characterized.

## 1-Methoxy-3-(3-methyl-3-phenylcyclobut-1-en-1-yl)benzene (32)

Cyclobutene 32 was synthetized following the general procedure starting from 1-ethynyl-3-methoxybenzene ( $21 \mu \mathrm{l}, 0.17 \mathrm{mmol}$ ) and $\alpha$ methylstyrene ( $44 \mu \mathrm{l}, 0.34 \mathrm{mmol}$ ) with [ BuXPhosAuNCMe$] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{B}$ $(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 8 h and a mixture of pentane and diethyl ether ( $9: 1$ ) was used as eluent in the separation to obtain cyclobutene $\mathbf{3 2}$ as a colorless oil in $78 \%$ isolated yield ( 33 mg , 0.13 mmol ). ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.47-7.43(\mathrm{~m}, 2 \mathrm{H})$, $7.40-7.35(\mathrm{~m}, 2 \mathrm{H}), 7.33-7.28(\mathrm{~m}, 1 \mathrm{H}), 7.25(\mathrm{td}, J=7.2,1.4 \mathrm{~Hz}, 1 \mathrm{H})$, $7.05(\mathrm{dt}, J=7.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.00-6.95(\mathrm{~m}, 1 \mathrm{H}), 6.87(\mathrm{dd}, J=7.8,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.78(\mathrm{~s}$, $1 \mathrm{H}), 3.87(\mathrm{~s}, 3 \mathrm{H}), 3.02(\mathrm{~d}, J=12.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.95(\mathrm{~d}, J=12.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 159.8$ (s), 147.7 (s), 143.8 (s), 136.2 (s), 134.2 (s), 129.5 (s), 128.2 (s), 125.9 (s), 125.8 (s), 117.3 (s), 113.7 (s), 109.9 (s), 55.3 (s), 46.0 ( s), 44.4 (s), 27.6 (s). ## 1-Chloro-3-(3-methyl-3-phenylcyclobut-1-en-1-yl)benzene (36)

Cyclobutene 36 was synthetized following the general procedure starting from 1-ethynyl-3-chlorobenzene ( $21 \mu \mathrm{l}, 0.17 \mathrm{mmol}$ ) and $\alpha$ methylstyrene ( $44 \mu \mathrm{l}, 0.34 \mathrm{mmol}$ ) with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{B}$ $(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 24 h and a mixture of pentane and diethyl ether ( $90: 1$ ) was used as eluent in the separation to obtain cyclobutene 36 as a yellowish oil in $83 \%$ isolated yield ( 36 mg , $0.141 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.40-7.35(\mathrm{~m}, 3 \mathrm{H})$, $7.35-7.30(\mathrm{~m}, 2 \mathrm{H}), 7.27-7.17(\mathrm{~m}, 4 \mathrm{H}), 6.77(\mathrm{~s}, 1 \mathrm{H}), 2.96(\mathrm{~d}, J=12.5$ $\mathrm{Hz}, 1 \mathrm{H}), 2.89(\mathrm{~d}, J=12.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, CDCl $\left.{ }_{3}, \mathrm{ppm}\right) \delta$ 147.3 (s), 142.7 (s), 136.6 (s), 135.5 (s), 134.5 ( s), 129.7 (s), 128.3 (s), 127.8 (s), 125.9 (s), 124.9 (s), 122.8 (s), 46.3 (s), 44.3 (s), 27.6 (s). HRMS-APCI m/z calculated for $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{Cl}$ $[\mathrm{M}+\mathrm{H}]^{+} 255.0935$, found 255.0935 .

## 1-Methoxy-3-(3-methyl-3-phenylcyclobut-1-en-1-yl)benzene (37)

Cyclobutene 37 was synthetized following the general procedure starting from 1-ethynyl-2-methoxybenzene ( $22 \quad \mu \mathrm{l}, \quad 0.17 \mathrm{mmol}$ ) and $\alpha$ methylstyrene $(44 \mu l, 0.34 \mathrm{mmol})$ with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{B}(7.7$ $\mathrm{mg}, 0.05 \mathrm{mmol}$ ). The reaction time was 48 h and a mixture of pentane and diethyl ether ( $9: 1$ ) was used as eluent in the separation to obtain cyclobutene 37 as a colorless oil in $24 \%$ isolated yield ( $11 \mathrm{mg}, 0.044$ mmol). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.47-7.39$ (m, 2H), $7.36-$ $7.28(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.14(\mathrm{~m}, 3 \mathrm{H}), 6.98-6.86(\mathrm{~m}, 2 \mathrm{H}), 6.80(\mathrm{~s}, 1 \mathrm{H}), 3.92(\mathrm{~s}, 3 \mathrm{H}), 3.03(\mathrm{~d}$, $J=12.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.95(\mathrm{~d}, J=12.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.65(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ $\delta 158.6$ (s), 148.2 (s), 140.2 (s), 138.7 (s), 128.9 (s), 128.1 (s), 127.1 (s), 126.0 (s), 125.6 (s), 123.5 (s), 120.3 (s), 110.5 (s), 55.2 (s), $46.8(\mathrm{~s}), 45.4(\mathrm{~s}), 27.8(\mathrm{~s})$. HRMS-APCI m/z calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}[\mathrm{M}+\mathrm{H}]^{+}$251.1430, found 251.1433.

## 3-(3-Methyl-3-phenylcyclobut-1-en-1-yl)thiophene (38)

Cyclobutene 38 was synthetized following the general procedure starting from 3-ethynylthiophene ( $17 \mu \mathrm{l}, 0.17 \mathrm{mmol}$ ) and $\alpha$-methylstyrene ( $44 \mu \mathrm{l}$, $0.34 \mathrm{mmol})$ with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAF}^{\mathrm{F}}{ }_{4} \mathbf{B}(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 24 h and a mixture of pentane and diethyl ether ( $90: 1$ ) was used as eluent in the separation to obtain cyclobutene $\mathbf{3 8}$ as a brownish oil in $86 \%$ yield ( $33 \mathrm{mg}, 0.146 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.43-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.36-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.30(\mathrm{dd}, J=$ $5.0,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.23-7.19(\mathrm{~m}, 2 \mathrm{H}), 7.17(\mathrm{dd}, J=3.0,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.51(\mathrm{~s}, 1 \mathrm{H}), 2.97$ (d, $J=12.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{~d}, J=12.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.65(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, $\mathrm{ppm}) \delta 147.8(\mathrm{~s}), 139.3(\mathrm{~s}), 137.8(\mathrm{~s}), 132.7$ (s), 128.2 (s), $126.0(\mathrm{~s}), 125.9(\mathrm{~s}), 125.8(\mathrm{~s})$, 125.1 (s), 121.1 (s), 47.1 (s), 45.2 (s), 27.7 (s). HRMS-APCI m/z calculated for $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~S}$ $[\mathrm{M}+\mathrm{H}]^{+}$239.0889, found 239.0896.

## Triisopropyl((1-methyl-3-phenylcyclobut-2-en-1-yl)methyl)silane (43)

Cyclobutene 43 was synthetized following the general procedure starting from phenylacetylene (19 $\mu \mathrm{l}, 0.17 \mathrm{mmol})$ and allyltriisopropylsilane (81 $\mu \mathrm{l}, \quad 0.34 \mathrm{mmol})$ with $\left[{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{B}(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 72 h and a mixture of pentane $100 \%$ was used as eluent in the separation. Cyclobutene 43 was isolated as a colorless oil. ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.38-7.28(\mathrm{~m}, 4 \mathrm{H}), 7.25-7.20(\mathrm{~m}, 1 \mathrm{H}), 6.39(\mathrm{~d}, J=1.1$ $\mathrm{Hz}, 1 \mathrm{H}), 3.07-2.94(\mathrm{~m}, 2 \mathrm{H}), 2.31(\mathrm{dd}, J=12.4,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.08(\mathrm{~s}, 23 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 143.8$ (s), 135.2 (s), 133.7 (s), 128.4 (s), 127.5 (s), 124.4 (s), 38.6 (s), 35.5 (s), 19.0 (s), 15.3 (s), 11.4 (s). HRMS-APCI m/z calculated for $\mathrm{C}_{20} \mathrm{H}_{32} \mathrm{Si}$ $[\mathrm{M}+\mathrm{H}]^{+} 301.2346$, found 301.2352 .

## (3-Methyl-3-(phenoxymethyl)cyclobut-1-en-1-yl)benzene (44)

Cyclobutene 44 was synthetized following the general procedure starting from phenylacetylene $(19 \quad \mu \mathrm{l}, 0.17 \mathrm{mmol})$ and ((2methylallyl)oxy)benzene $(52 \quad \mu \mathrm{l}, \quad 0.34 \quad \mathrm{mmol}) \quad$ with ['BuXPhosAuNCMe]BAr ${ }_{4}{ }^{t} \mathbf{B}(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 72 h and a mixture of pentane and diethyl ether (20:1) was used as eluent in the separation in a preparative TLC in alumina oxide. Cyclobutene 44 was isolated as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.39-7.36(\mathrm{~m}, 2 \mathrm{H}), 7.36-7.31(\mathrm{~m}, 2 \mathrm{H}), 7.30-7.26(\mathrm{~m}$, $3 \mathrm{H}), 6.96-6.91(\mathrm{~m}, 3 \mathrm{H}), 6.47(\mathrm{~s}, 1 \mathrm{H}), 3.98(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.95(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H})$, $2.74(\mathrm{~d}, J=12.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.56(\mathrm{~d}, J=12.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.42(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 159.6$ (s), 144.3 (s), 134.8 (s), 132.9 (s), 129.5 (s), 128.4 (s), 128.0 (s), 124.7 (s), 120.6 (s), 114.7 (s), 75.4 (s), 42.9 (s), 38.9 (s), 21.7 (s). HRMS-APCI m/z calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}[\mathrm{M}+\mathrm{H}]^{+}$251.1426, found 251.1430.

## ((1-methyl-3-phenylcyclobut-2-en-1-yl)methoxy)triphenylsilane (45)

Cyclobutene 45 was synthetized following the general procedure starting from phenylacetylene $(19 \quad \mu 1, \quad 0.17 \mathrm{mmol})$ and ((2methylallyl)oxy)triphenylsilane ( $112 \mathrm{mg}, \quad 0.34 \mathrm{mmol}$ ) with [ $\left.{ }^{t} \mathrm{BuXPhosAuNCMe}\right] \mathrm{BAr}^{\mathrm{F}}{ }_{4} \mathbf{B}(7.7 \mathrm{mg}, 0.05 \mathrm{mmol})$. The reaction time was 72 h and a mixture of pentane and diethyl ether (20:1) was used as eluent in the separation in a preparative TLC in alumina oxide. Cyclobutene 45 was isolated as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.68-7.57(\mathrm{~m}, 6 \mathrm{H}), 7.46-7.28(\mathrm{~m}, 14 \mathrm{H}), 6.29(\mathrm{~s}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 2 \mathrm{H}), 2.61$ $(\mathrm{d}, J=12.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.40(\mathrm{~d}, J=12.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.30(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 143.9$ (s), 135.6 (s), 135.0 (s), 134.6 (s), 133.5 (s), 130.0 (s), 128.3 (s), 127.9 (s), 127.7 (s), 124.6 (s), $71.0(\mathrm{~s}), 44.6$ (s), 38.3 (s), 21.5 (s). HRMS-APCI m/z calculated for $\mathrm{C}_{30} \mathrm{H}_{28} \mathrm{OSi}[\mathrm{M}+\mathrm{H}]^{+} 433.1982$, found 433.1984.

## 5. Towards the Total Synthesis of Rumphellaone $A$

All the reactants, ligands and the following reagents were purchased from comercial sources and used without further purification: (furan-2-yloxy)trimethylsilane, 2(diethoxymethyl)furan, furan-2-carboxylic acid, maleic anhydride, 2-methylfuran, 6-methylhept-5-en-2-one, butane-1,4-diol, 2,2,7,7-tetramethyl-3,6-dioxa-2,7-disilaoctane, ethynylbenzene, 1-ethynyl-3-methylbenzene, 3-ethynylphenol, 1-ethynyl-3methoxybenzene and BINOL. $\mathrm{Mn}(\mathrm{dpm})_{3}$ and Crabtree's catalyst were synthesized as reported. ${ }^{1,2}$ JohnPhosAuCl, ${ }^{\text {t }} \mathrm{BuXPhosAuCl}, \mathrm{IPrAuCl}, \mathrm{Ph}_{3} \mathrm{PAuCl}$, (THT)AuCl, (44)AuCl and complexes $\mathbf{E}, \mathbf{V}, \mathbf{W}, \mathbf{X}, \mathbf{Y}, \mathbf{Z}, \mathbf{L} \mathbf{~ a n d ~} \mathbf{S S}$ were also prepared according to the literature. ${ }^{3,4,5,6}$ Cyclobutene 19 was characterized in Chapter 2 and complex $\mathbf{Q}$ in Chapter $4 .{ }^{7,8}$

## Procedures for the Silyloxyalkynylfuran Approach

(Z)-4-Oxo-6-(trimethylsilyl)hex-2-en-5-ynoic acid (40)

$\mathrm{AlCl}_{3}$ ( $140 \mathrm{mg}, 1.11 \mathrm{mmol}$ ) was added portion-wise to an icecooled solution of maleic anhydride ( $98 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) and 1,2bis(trimethylsilyl)ethyne ( $170 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8.5 \mathrm{ml})$. The mixture was stirred at $0^{\circ} \mathrm{C}$ for 2 h and then at $25^{\circ} \mathrm{C}$ for 20 h . The reaction was quenched with 1 M HCl and the phases were separeted. The organic layeres were washed with water and dried with $\mathrm{MgSO}_{4}$. The crude was concentrated and purified with cyclohexane:ethyl acetate (2:1) with $1 \%$ formic acid. (Z)-4-oxo-6-(trimethylsilyl)hex-2-en-5-ynoic acid 40 was obtained in $25 \%$ isolated yield ( $46.2 \mathrm{mg}, 0.24$ mmol). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.10(\mathrm{~d}, J=15.67 \mathrm{~Hz}, 1 \mathrm{H}), 6.93(\mathrm{~d}, J=16.02$ $\mathrm{Hz}, 1 \mathrm{H}), 0.29(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 127.44(\mathrm{~s}), 169.10(\mathrm{~s}), 142.41$ (s), 134.27 (s), 102.01 (s), 99.98 (s), - 0.68 (s). $\mathrm{ESI}^{-} m / z$ calc for $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{O}_{3} \mathrm{Si}^{+}[\mathrm{M}-\mathrm{H}]^{-}$ 195.0483, found 195.0483 ( 0.0 ppm ).

[^104]
## 2-Iodo-5-methylfuran

To a solution of 2-methylfuran ( $0.54 \mathrm{ml}, 6.09 \mathrm{mmol}$ ) in THF ( 15.0 ml ), 2 M ${ }^{n} \operatorname{BuLi}(3.35 \mathrm{ml}, 6.70 \mathrm{mmol})$ was added at $-10^{\circ} \mathrm{C}$. The reaction mixture was stirred for 2 h and 1,2-diiodoethane ( $1.91 \mathrm{~g}, 6.70 \mathrm{mmol}$ ) was added. The solution was stirred for 18 h at $25^{\circ} \mathrm{C}$. The product was extracted with diethyl ether and washed with brine. The organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated carefully. 2-Iodo-5-methylfuran was obtained in $60 \%$ isolated yield ( $0.76 \mathrm{~g}, 3.67 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 6.40(\mathrm{~d}, J=3.02 \mathrm{~Hz}, 1 \mathrm{H}), 5.92-5.91(\mathrm{~m}, 1 \mathrm{H}), 2.34(\mathrm{~d}, J=0.82$ $\mathrm{Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 158.41$ (s), 120.72 (s), 109.18 (s), 88.37 (s), 14.01 (s).

## 2-Tert-butyldimethylsilyloxyfuran

To a solution of furan-2(5H)-one ( $0.84 \mathrm{ml}, 11.89 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10.0 \mathrm{ml})$ was added $\mathrm{Et}_{3} \mathrm{~N}(3.32 \mathrm{ml}, 23.79 \mathrm{mmol})$. The solution was cooled down in an ice bath for 30 min and tert-butyldimethylsilyl trifluoromethanesulfonate ( $3.28 \mathrm{ml}, 14.27 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 2 h and quenched with water. The phases were separated, the organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. Kugelrohr destillation at $100{ }^{\circ} \mathrm{C}$ and 10 Torr afforded tert-butyl(furan-2-yloxy)dimethylsilane in $68 \%$ isolated yield ( $1.54 \mathrm{~g}, 7.80 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}$ ) $\delta 6.82$ (dd, $\left.J=2.32,1.11 \mathrm{~Hz}, 1 \mathrm{H}\right), 6.21$ (dd, $J=3.18,2.23 \mathrm{~Hz}$, $1 \mathrm{H}), 5.11(\mathrm{dd}, J=3.17,1.07 \mathrm{~Hz}, 1 \mathrm{H}), 0.96(\mathrm{~s}, 9 \mathrm{H}), 0.23(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 126 MHz , $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta 157.52$ (s), 132.77 (s), 111.54 (s), 84.01 (s), 25.98 (s), 25.76 (s), 4.63 (s).

## 2-Triisopropylsilyloxyfuran

To a solution of furan-2(5H)-one ( $0.84 \mathrm{ml}, 11.89 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10.0$ $\mathrm{ml})$ was added $\mathrm{Et}_{3} \mathrm{~N}(3.32 \mathrm{ml}, 23.79 \mathrm{mmol})$. The solution was cooled down in an ice bath for 30 min and triisopropylsilyl trifluoromethanesulfonate ( $3.95 \mathrm{ml}, 14.27 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 16 h and quenched with water. The phases were separated, the organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. Kugelrohr destillation at $100{ }^{\circ} \mathrm{C}$ and 0.1 Torr afforded (furan-2ylpxy)triisopropylsilane in $84 \%$ isolated yield ( $2.40 \mathrm{~g}, 9.97 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 6.80(\mathrm{dd}, J=2.25,1.07 \mathrm{~Hz}, 1 \mathrm{H}), 6.20(\mathrm{dd}, J=2.98,2.26 \mathrm{~Hz}, 1 \mathrm{H}), 5.12(\mathrm{dd}$, $J=3.20,1.12 \mathrm{~Hz}, 1 \mathrm{H}), 1.30-1.21(\mathrm{~m}, 3 \mathrm{H}), 1.09(\mathrm{~d}, J=7.24 \mathrm{~Hz}, 18 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (101 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 157.14$ (s), 131.97 (s), 111.22 (s), 83.59 (s), 17.67 (s), 12.34 (s).

## 2-Trimethylsilylethynyl-5-methylfuran (41)

${ }^{t}$ BuLi 1.5 M in diethyl ether ( $10.0 \mathrm{ml}, 16.50 \mathrm{mmol}$ ) was added dropwise over 2-methylfuran ( $1.35 \mathrm{ml}, 15.00 \mathrm{mmol}$ ) in diethyl ether ( 30.0 ml ) under inert conditions at $-78^{\circ} \mathrm{C}$. The solution was stirred for 1 h at this temperature and 1,2 -diiodoethane ( $4.65 \mathrm{~g}, 16.50 \mathrm{mmol}$ ) in diethyl ether ( 45.0 ml ) was added. The reaction mixture was stirred for an additional 30 min , warmed to $25^{\circ} \mathrm{C}$ and quenched it with a saturated solution of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$. Then, it was extracted with diethyl ether, washed with brine and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. THF ( 13.0 ml ) was added to the crude and diethyl ether was evaporated under vacuum carefully. Ethynyltrimethylsilane ( 3.18 ml , $22.50 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(6.28 \mathrm{ml}, 45.00 \mathrm{mmol})$ were added and the solution was degassed with argon for 15 min . Bis(triphenylphosphine)palladium (II) dichloride ( $0.21 \mathrm{~g}, 0.30$ $\mathrm{mmol})$ was added and the reaction mixture stirred for 1 min at $25^{\circ} \mathrm{C}$ followed by $\mathrm{CuI}(0.11$
$\mathrm{g}, 0.60 \mathrm{mmol})$. The solution was stirred for an additional 2 h . The crude was concentrated and purified by silica gel column chromatography eluting with pure cyclohexane to obtain trimethyl((5-methylfuran-2-yl)ethynyl)silane 41 in $35 \%$ isolated yield ( $0.93 \mathrm{~g}, 5.25 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, \mathrm{ppm}\right) \delta 6.52(\mathrm{dd}, J=3.27,0.51 \mathrm{~Hz}, 1 \mathrm{H}), 5.66(\mathrm{dq}, J=3.27$, $1.00 \mathrm{~Hz}, 1 \mathrm{H}), 1.92(\mathrm{dd}, J=1.14,0.48 \mathrm{~Hz}, 3 \mathrm{H}), 0.27(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$, ppm) $\delta 153.87$ (s), 136.35 (s), 117.29 (s), 107.19 (s), 99.02 (s), 96.04 (s), 13.47 (s), 0.19 (s).

## 2-Ethynyl-5-methylfuran

2-Trimethylsilylethynyl-5-methylfuran ( $516.0 \mathrm{mg}, 2.89 \mathrm{mmol}$ ) was dissolved in methanol $(15.0 \mathrm{ml})$ under inert conditions and $\mathrm{K}_{2} \mathrm{CO}_{3}$ (800.0 $\mathrm{mg}, 5.79 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 15 min and was quenched with water. The solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the organic layers dried with $\mathrm{MgSO}_{4}$ and concentrated under vacuum without drying it. An exact solution was prepared in 5 ml of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the concentration was determined using diphenylmethane as internal standard. 2-Ethynyl-5-methylfuran was obtained in $60 \%$ yield $(184.0 \mathrm{mg}, 1.73 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, \mathrm{ppm}\right) \delta 6.34(\mathrm{~d}, J=3.22 \mathrm{~Hz}, 1 \mathrm{H}), 5.62$ $(\mathrm{dq}, J=3.30,0.95 \mathrm{~Hz}, 1 \mathrm{H}), 3.01(\mathrm{~s}, 1 \mathrm{H}), 1.91(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, \mathrm{ppm}$ ) $\delta 154.08$ ( s), 135.16 (s), 117.56 (s), 107.09 (s), 81.73 (s), 74.76 (s), 13.50 (s).

## 2-Methyl-5-(3-methyl-3-phenylcyclobut-1-en-1-yl)furan (42)

2-Ethynyl-5-methylfuran ( $21.00 \mathrm{mg}, 0.20 \mathrm{mmol}$ ) was dissolvded in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.40 \mathrm{ml})$ and $\alpha$-methylstyrene ( $52.00 \mu \mathrm{l}, 0.40 \mathrm{mmol}$ ) undert inert conditions, ${ }^{t} \mathrm{BuXPhosAuCl}(6.57 \mathrm{mg}, 10.00 \mu \mathrm{~mol})$ and $\mathrm{NaBAr}_{4}{ }_{4}$ $(8.86 \mathrm{mg}, 10.00 \mu \mathrm{~mol})$ were added sequentially. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 24 h and quenched with a drop of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel preparative TLC eluting with pure pentane. 2-Methyl-5-(3-methyl-3-phenylcyclobut-1-en-1-yl)furan 42 was obtained in $64 \%$ isolated yield $(28.8 \mathrm{mg}, 0.13 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.40-7.37(\mathrm{~m}$, $2 \mathrm{H}), 7.35-7.30(\mathrm{~m}, 2 \mathrm{H}), 7.22-7.18(\mathrm{~m}, 1 \mathrm{H}), 6.43(\mathrm{~s}, 1 \mathrm{H}), 6.17(\mathrm{~d}, J=3.16 \mathrm{~Hz}, 1 \mathrm{H}), 5.97$ (dq, $J=3.26,0.97 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{~d}, \mathrm{~J}=12.44 \mathrm{~Hz}, 1 \mathrm{H}), 2.85(\mathrm{~d}, \mathrm{~J}=12.38 \mathrm{~Hz}, 1 \mathrm{H}), 2.33(\mathrm{~s}$, $3 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}){ }^{13}{ }^{13} \mathrm{CNMR}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 152.46(\mathrm{~s}), 149.22(\mathrm{~s}), 147.78$ (s), 133.84 (s), 130.57 (s), 128.22 (s), 125.92 (s), 125.82 (s), 108.29 (s), 107.23 (s), 47.88 (s), $44.25(\mathrm{~s}), 27.77(\mathrm{~s}), 13.81(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C} 16 \mathrm{H} 17 \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+} 225.1274$, found 225.1269 ( 2.4 ppm ).

## 4-(4,4-Dimethyl-2-(5-methylfuran-2-yl)cyclobut-2-en-1-yl)butan-2-one (43)

2-Ethynyl-5-methylfuran ( $106.0 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) was dissolved in DCE ( 5.0 ml ) and 6-methylhep-5-en-2-one ( $295.0 \mu \mathrm{l}, 2.00 \mathrm{mmol}$ ) under inert conditions, ${ }^{t} \mathrm{BuXPhosAuCl}(32.9 \mathrm{mg}, 50.0 \mu \mathrm{~mol})$ and $\mathrm{NaBAr}^{\mathrm{F}} 4(44.3 \mathrm{mg}, 50.0 \mu \mathrm{~mol})$ were added sequentially. The reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for 2 h and quenched with a drop of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel column chromatography eluting with pentane:diethyl ether (20:1). 4-(4,4-Dimethyl-2-(5-methylfuran-2-yl)cyclobut-2-en-1-yl)butan-2-one 43 was obtained in $31 \%$ isolated yield $(72.0 \mathrm{mg}, 0.30 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}$ ) $\delta 6.15(\mathrm{~d}, \mathrm{~J}=3.20 \mathrm{~Hz}, 1 \mathrm{H}), 5.99$ $(\mathrm{s}, 1 \mathrm{H}), 5.97-5.95(\mathrm{~m}, 1 \mathrm{H}), 2.58-2.50(\mathrm{~m}, 3 \mathrm{H}), 2.28(\mathrm{~s}, 3 \mathrm{H}), 2.01-1.92(\mathrm{~m}, 1 \mathrm{H}), 1.74-$
$1.64(\mathrm{~m}, 1 \mathrm{H}), 1.58(\mathrm{~s}, 3 \mathrm{H}), 1.22(\mathrm{~s}, 3 \mathrm{H}), 1.14(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{ppm}\right) \delta$ 208.75 ( s ), 152.43 ( s ), 149.22 ( s ), 136.46 ( s$), 133.44$ ( s$), 108.40$ ( s$), 107.51$ (s), 51.83 (s), $44.64(\mathrm{~s}), 43.06(\mathrm{~s}), 30.22(\mathrm{~s}), 28.01(\mathrm{~s}), 24.11(\mathrm{~s}), 22.24(\mathrm{~s}), 13.89(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C} 15 \mathrm{H} 21 \mathrm{O} 2^{+}[\mathrm{M}+\mathrm{H}]^{+} 233.1536$, found 233.1531 ( 2.2 ppm ).

## Procedures for the Oxidation Approach

## 2-Methyl-2-(4-methylpent-3-en-1-yl)-1,3-dioxepane (55)

To a solution of 6-methylhept-5-en-2-one ( $4.43 \mathrm{ml}, 30.00 \mathrm{mmol}$ ), triethoxymethane ( $5.49 \mathrm{ml}, 33.00 \mathrm{mmol}$ ) and butane-1,4-diol ( 5.00 $\mathrm{ml}, 56.40 \mathrm{~mol}$ ) in THF ( 60.0 ml ) under inert conditions, $\mathrm{FeCl}_{3}$ ( 487.0 $\mathrm{mg}, 3.00 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 24 h and quenched with aqueous $\mathrm{NaOH} 10 \%$. The solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the organic layers washed with water and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude was purified by distillation at $120{ }^{\circ} \mathrm{C}$ and 0.75 Torr and 2-methyl-2-(4-methylpent-3-en-1-yl)-1,3dioxepane 55 was obtained in $83 \%$ isolated yield ( $4.91 \mathrm{~g}, 24.76 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 5.14-5.09(\mathrm{~m}, 1 \mathrm{H}), 3.68-3.65(\mathrm{~m}, 4 \mathrm{H}), 2.05-1.98(\mathrm{~m}, 2 \mathrm{H}), 1.68$ $(\mathrm{d}, J=0.98 \mathrm{~Hz}, 3 \mathrm{H}), 1.65-1.58(\mathrm{~m}, 9 \mathrm{H}), 1.28(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 131.70$ (s), 124.32 ( s$), 102.63$ ( s$), 62.11$ ( s$), 37.81$ ( s$), 29.93$ (s), 25.82 (s), 23.29 (s), 22.54 (s), 17.76 (s).

## 2-(2-(4,4-Dimethyl-2-phenylcyclobut-2-en-1-yl)ethyl)-2-methyl-1,3-dioxepane (56)

To a solution of 2-methyl-2-(4-methylpent-3-en-1-yl)-1,3-dioxepane $55(44.0 \mu \mathrm{l}, 0.20 \mathrm{mmol})$ and ethynylbenzene ( $220.0 \mu \mathrm{l}, 2.00 \mathrm{mmol}$ ) under inert conditions, [ ${ }^{t}$ BuXPhosAuNCMe]BAr ${ }_{4}{ }_{4}(15.0 \mathrm{mg}, 10.00$ $\mu \mathrm{mol})$. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 48 h and quenched with a drop of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel prep-TLC eluting with cyclohexane:ethyl acetate (5:1). 2-(2-(4,4-Dimethyl-2-phenylcyclobut-2-en-1-yl)ethyl)-2-methyl-1,3dioxepane 56 was obtained in $51 \%$ isolated yield ( $30.3 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.34-7.28(\mathrm{~m}, 4 \mathrm{H}), 7.23-7.19(\mathrm{~m}, 1 \mathrm{H}), 6.29(\mathrm{~s}, 1 \mathrm{H}), 3.69-3.64$ $(\mathrm{m}, 4 \mathrm{H}), 2.71(\mathrm{~d}, J=10.94,3.63 \mathrm{~Hz}, 1 \mathrm{H}), 1.87-1.78(\mathrm{~m}, 1 \mathrm{H}), 1.75-1.65(\mathrm{~m}, 1 \mathrm{H}), 1.61-$ $1.57(\mathrm{~m}, 4 \mathrm{H}), 1.53-1.40(\mathrm{~m}, 2 \mathrm{H}), 1.27(\mathrm{~s}, 3 \mathrm{H}), 1.25(\mathrm{~s}, 3 \mathrm{H}), 1.19(\mathrm{~s}, 3 \mathrm{H})$.

## 4-(4,4-Dimethyl-2-phenylcyclobut-2-en-1-yl)butan-2-one (19)

6-Methylhep-5-en-2-one ( $0,74 \mathrm{ml}, 5.00 \mathrm{mmol}$ ) and ethynylbenzene $(2.2 \mathrm{ml}, 20.00 \mathrm{mmol})$ were dissolved in DCE $(10.0 \mathrm{ml})$ under inert conditions and ${ }^{t} \mathrm{BuXPhosAuCl}(164.0 \mathrm{mg}, 0.25 \mathrm{mmol})$ and $\mathrm{NaBAr}_{4}{ }_{4}$ $(222.0 \mathrm{mg}, 0.25 \mathrm{mmol})$ were added sequentially. The reaction mixture was stirred at $50^{\circ} \mathrm{C}$ for 19 h and quenched with 1 ml of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel column chromatography eluting with pentane:diethyl ether (20:1). 4-(4,4-Dimethyl-2-phenylcyclobut-2-en-1-yl)butan-2-one 19 was obtained in $78 \%$ isolated yield ( $0.89 \mathrm{~g}, 3.88 \mathrm{mmol}$ ). This compound was characterized in Chapter 2.

## 4-(2-(3-Hydroxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one (60)

6-Methylhep-5-en-2-one ( $74.0 \mu \mathrm{l}, 0.50 \mathrm{mmol}$ ) and 3-ethynylphenol $(273.0 \mu \mathrm{l}, 2.00 \mathrm{mmol})$ were dissolved in DCE ( 1.0 ml ) under inert conditions and ${ }^{t} \mathrm{BuXPhosAuCl}(16.4 \mathrm{mg}, 25.00 \mu \mathrm{~mol})$ and $\mathrm{NaBAr}_{4}^{\mathrm{F}}$ $(22.2 \mathrm{mg}, 25.00 \mu \mathrm{~mol})$ were added sequentially. The reaction mixture was stirred at $50{ }^{\circ} \mathrm{C}$ for 19 h and quenched with 1 ml of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel column chromatography eluting with cyclohexane:ethyl acetate (5:1). 4-(2-(3-Hydroxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one $\mathbf{6 0}$ was obtained in $40 \%$ isolated yield ( $47.6 \mathrm{mg}, 0.19 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.22(\mathrm{t}, J=7.95$ $\mathrm{Hz}, 1 \mathrm{H}), 6.92$ (ddd, $J=7.58,1.49,1.21 \mathrm{~Hz}, 1 \mathrm{H}), 6.87(\mathrm{dd}, J=2.67,1.57 \mathrm{~Hz}, 1 \mathrm{H}), 6.77$ (ddd, $J=8.17,2.64,0.84 \mathrm{~Hz}, 1 \mathrm{H}), 6.27(\mathrm{~s}, 1 \mathrm{H}), 2.67(\mathrm{dd}, J=10.73,4.47 \mathrm{~Hz}, 1 \mathrm{H}), 2.53-$ $2.47(\mathrm{~m}, 2 \mathrm{H}), 2.14(\mathrm{~s}, 3 \mathrm{H}), 2.12-2.05(\mathrm{~m}, 1 \mathrm{H}), 1.71-1.61(\mathrm{~m}, 1 \mathrm{H}), 1.23(\mathrm{~s}, 3 \mathrm{H}), 1.15(\mathrm{~s}$, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 208.62$ (s), 159.79 (s), 145.50 (s), 136.78 (s), 136.05 ( s ), 129.46 ( s$), 117.77$ ( s$), 113.29$ ( s$), 110.48$ ( s$), 55.27$ (s), 51.02 (s), 42.78 (s), $30.00(\mathrm{~s}), 27.88(\mathrm{~s}), 23.33(\mathrm{~s}), 21.85(\mathrm{~s}) . \mathrm{ESI}^{-} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{O}_{2}{ }^{-}[\mathrm{M}-\mathrm{H}]^{-}$243.1391, found 243.1389 ( 0.2 ppm ).

## 4-(2-(3-Methoxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one (61)

6-Methylhep-5-en-2-one ( $74.0 \mu \mathrm{l}, 0.50 \mathrm{mmol}$ ) and 1-ethynyl-3methoxybenzene ( $318.0 \mu \mathrm{l}, 2.00 \mathrm{mmol}$ ) were dissolved in DCE ( 1.0 ml ) under inert conditions and ${ }^{t} \mathrm{BuXPhosAuCl}(16.4 \mathrm{mg}, 25.00$ $\mu \mathrm{mol})$ and $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}(22.2 \mathrm{mg}, 25.00 \mu \mathrm{~mol})$ were added sequentially. The reaction mixture was stirred at $50{ }^{\circ} \mathrm{C}$ for 19 h and quenched with 1 ml of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel column chromatography eluting with pentane:diethyl ether (20:1). 4-(2-(3-Methoxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one $\mathbf{6 1}$ was obtained in $65 \%$ isolated yield ( $83.6 \mathrm{mg}, 0.32 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta$ $7.25(\mathrm{t}, J=7.91 \mathrm{~Hz}, 1 \mathrm{H}), 6.96(\mathrm{ddd}, J=7.64,1.60,0.99 \mathrm{~Hz}, 1 \mathrm{H}), 6.91(\mathrm{dd}, J=2.62,1.51$ $\mathrm{Hz}, 1 \mathrm{H}), 6.80(\mathrm{ddd}, J=8.25,2.59,0.80 \mathrm{~Hz}, 1 \mathrm{H}), 6.30(\mathrm{~s}, 1 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 2.71(\mathrm{dd}, J=$ $10.62,4.31 \mathrm{~Hz}, 1 \mathrm{H}), 2.57-2.51(\mathrm{~m}, 2 \mathrm{H}), 2.17(\mathrm{~s}, 3 \mathrm{H}), 2.15-2.09(\mathrm{~m}, 1 \mathrm{H}), 1.75-1.65$ $(\mathrm{m}, 1 \mathrm{H}), 1.27(\mathrm{~s}, 3 \mathrm{H}), 1.19(\mathrm{~s}, 3 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 208.55(\mathrm{~s}), 159.73$ (s), 145.43 (s), 136.72 (s), 135.98 (s), 129.42 (s), 117.71 (s), 113.22 (s), 110.42 (s), 55.19 (s), 50.95 (s), 42.76 (s), 42.70 (s), 29.95 (s), 27.84 (s), 23.26 (s), 21.80 (s). $\mathrm{ESI}^{+} m / z$ calc for $\mathrm{C}_{17} \mathrm{H}_{22} \mathrm{NaO}_{2}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$281.1512, found $281.1500(1.2 \mathrm{ppm})$.

## 4-(4,4-Dimethyl-2-(m-tolyl)cyclobut-2-en-1-yl)butan-2-one (62)

6-Methylhep-5-en-2-one ( $74.0 \mu \mathrm{l}, 0.50 \mathrm{mmol}$ ) and 1-ethynyl-3methylbenzene ( $200.0 \quad \mu \mathrm{l}, \quad 1.75 \mathrm{mmol}$ ) were dissolved in dichloroethane ( 1.00 ml ) under inert conditions and ${ }^{t} \mathrm{BuXPhosAuCl}$ $(16.4 \mathrm{mg}, 25.00 \mu \mathrm{~mol})$ and $\mathrm{NaBAr}^{\mathrm{F}}{ }_{4}(22.2 \mathrm{mg}, 25.00 \mu \mathrm{~mol})$ were added sequentially. The reaction mixture was stirred at $50^{\circ} \mathrm{C}$ for 19 h and quenched with 1 ml of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified with silica gel column chromatography eluting with pentane:diethyl ether (20:1). 4-(4,4-Dimethyl-2-(m-tolyl)cyclobut-2-en-1-yl)butan-2-one 62 was obtained in 44\% isolated yield ( $53.6 \mathrm{mg}, 0.22 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.22(\mathrm{t}, J=7.60$ $\mathrm{Hz}, 1 \mathrm{H}), 7.17-7.14(\mathrm{~m}, 2 \mathrm{H}), 7.05(\mathrm{~d}, J=7.54 \mathrm{~Hz}, 1 \mathrm{H}), 6.27(\mathrm{~s}, 1 \mathrm{H}), 2.71(\mathrm{dd}, J=10.86$,

## 4-(4-(3-Methoxyphenyl)-2,2-dimethylcyclobutyl)butan-2-one (68)

To a solution of 4-(2-(3-methoxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one $\mathbf{6 1}(85.14 \mathrm{mg}, 0.33 \mathrm{mmol})$ in dry methanol $(3.90 \mathrm{ml}), \mathrm{Pd} / \mathrm{C} 10 \%(35.00 \mathrm{mg}, 32.89 \mu \mathrm{~mol})$ was added. The suspension was degassed with $\mathrm{H}_{2}$ gas for 10 min and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ and under $\mathrm{H}_{2}$ atmosphere (balloon) for 5 h . The crude was filtered through Teflon 0.22 and the solvent was removed under reduced pressure to obtain 4-(4-(3-methoxyphenyl)-2,2-dimethylcyclobutyl)butan-2-one $\mathbf{6 8}$ in $54 \%$ isolated yield as a mixture 1.7:1 of cis:trans diastereoisomers $(46.3 \mathrm{mg}, 0.18 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.22-7.17(\mathrm{~m}, 1 \mathrm{H}), 6.83-6.79(\mathrm{~m}, 1 \mathrm{H}), 6.78$ $-6.75(\mathrm{~m}, 1 \mathrm{H}), 6.74-6.70(\mathrm{~m}, 1 \mathrm{H}), 3.79(\mathrm{~s}, 3 \mathrm{H}), 3.73(\mathrm{q}, J=9.19 \mathrm{~Hz}, 0.7 \mathrm{H}), 2.93(\mathrm{q}, J=$ $9.02 \mathrm{~Hz}, 0.4 \mathrm{H}), 2.26-2.21(\mathrm{~m}, 0.7 \mathrm{H}), 2.18-2.09(\mathrm{~m}, 1.4 \mathrm{H}), 2.10-1.95(\mathrm{~m}, 3 \mathrm{H}), 1.93-$ $1.82(\mathrm{~m}, 3 \mathrm{H}), 1.75-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.54-1.39(\mathrm{~m}, 1 \mathrm{H}), 1.28(\mathrm{~s}, 2 \mathrm{H}), 1.12(\mathrm{~s}, 1.2 \mathrm{H}), 1.11$ $(\mathrm{s}, 1.1 \mathrm{H}), 1.02(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR for the mixture of diastereoisomers $\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 209.17$ (s), 208.89 (s), 159.72 (s), 159.62 (s), 146.88 (s), 143.00 (s), 129.34 (s), 129.09 ( s ), 120.94 ( s ), 119.43 ( s$), 114.36$ ( s$), 112.93$ ( s$), 111.13$ ( s$), 111.03$ (s), 55.22 (s), 51.69 (s), 48.15 ( s ), 42.31 ( s$), 41.66$ ( s$), 41.23$ ( s$), 37.18$ (s), 36.21 (s), 33.96 (s), 33.91 (s), 30.86 (s), 30.47 (s), 29.91 (s), 29.75 (s), 24.58 (s), 22.35 (s), 21.46 (s) and three carbon atoms missing due to overlapping. $\mathrm{ESI}^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{NaO}_{2}{ }^{+}[\mathrm{M}+\mathrm{Na}]^{+}$283.1669, found 283.1658 ( 0.9 ppm ).

## 4-(2,2-Dimethyl-4-(m-tolyl)cyclobutyl)butan-2-one (69)

To a solution of 4-(2-(3-methoxyphenyl)-4,4-dimethylcyclobut-2-en-1-yl)butan-2-one 62 ( $53.34 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) in dry methanol ( 2.60 $\mathrm{ml}), \mathrm{Pd} / \mathrm{C} 10 \%(24.00 \mathrm{mg}, 22.55 \mu \mathrm{~mol})$ was added. The suspension was degassed with $\mathrm{H}_{2}$ gas for 10 min and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ and under $\mathrm{H}_{2}$ atmosphere (balloon) for 5 h . The crude was filtered through Teflon 0.22 and the solvent was removed under reduced pressure to obtain 4-(2,2-dimethyl-4-(m-tolyl)cyclobutyl)butan-2-one $\mathbf{6 9}$ in $84 \%$ isolated yield as a mixture 1.4:1 of cis:trans diastereoisomers ( $45.4 \mathrm{mg}, 0.19 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.19-7.15(\mathrm{~m}, 1 \mathrm{H}), 7.03-6.98(\mathrm{~m}, 3 \mathrm{H}), 3.72(\mathrm{q}, J=8.94 \mathrm{~Hz}$, $0.6 \mathrm{H}), 2.91(\mathrm{q}, J=8.94 \mathrm{~Hz}, 0.4 \mathrm{H}), 2.33(\mathrm{~s}, 3 \mathrm{H}), 2.26-2.08(\mathrm{~m}, 1 \mathrm{H}), 2.20-2.10(\mathrm{~m}, \mathrm{~m}$, $1 \mathrm{H}), 2.05-1.94(\mathrm{~m}, 3 \mathrm{H}), 1.93-1.80(\mathrm{~m}, 3 \mathrm{H}), 1.75-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.53-1.40(\mathrm{~m}, 1 \mathrm{H})$, $1.28(\mathrm{~s}, 2 \mathrm{H}), 1.13(\mathrm{~s}, 1.2 \mathrm{H}), 1.12(\mathrm{~s}, 1.2 \mathrm{H}), 1.03(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR for the mixture of diastereoisomers ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{p} \mathrm{pm}$ ) $\delta 209.26$ (s), 208.98 (s), 145.04 (s), 141.11 (s), 137.85 (s), 137.60 (s), 129.15 (s), 128.28 (s), 128.06 (s), 127.74 (s), 126.78 ( s), 126.76 (s), 125.49 (s), 124.01 (s), 51.75 (s), 48.13 (s), 42.30 (s), 41.69 (s), 41.57 (s), 41.25 (s), 37.05 (s), 36.17 ( s ), 33.97 ( s , 33.87 ( s ), 30.87 ( s ), 30.48 ( s , 29.88 ( s ), 29.69 ( s$), 24.62$ ( s$), 24.59$ (s), $22.35(\mathrm{~s}), 21.55(\mathrm{~s}), 21.52(\mathrm{~s}), 21.49(\mathrm{~s}) . \mathrm{ESI}^{+} m / z$ calc for $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{NaO}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$ 267.1719, found 267.1712 ( 0.7 ppm ).

## 3,3-Dimethyl-2-(3-oxobutyl)cyclobutane-1-carboxylic acid (46)

To a 1000 ml round-bottom flask, 4-(2,2-dimethyl-4-phenylcyclobutyl)butan-2-one 45 ( $287.5 \mathrm{mg}, 1.25 \mathrm{mmol}$ ) was dissolved in 150 ml of a mixture of water:ethyl acetate (3:1) and cooled down to $4{ }^{\circ} \mathrm{C}$. Then, $\mathrm{NaIO}_{4}(4.00 \mathrm{~g}, 18.75 \mathrm{mmol})$ followed by
ruthenium (IV) oxide monohydrate ( $20.00 \mathrm{mg}, 0.13 \mathrm{mmol}$ ) were added sequentially. The reaction mixture was stirred vigorously for 30 h at $25^{\circ} \mathrm{C}$. After extraction with ethyl acetate, the organic layers were washed with a mixture of brine:saturated $\mathrm{Na}_{2} \mathrm{SO}_{3}$ (10:1). The aqueous phase was acidified with concentrated HCl to pH 2 and extracted again. The combined organic layers were then washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ followed by extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The aqueous phase was acidified again and extracted with ethyl acetate. The solvent was evaporated under reduced pressure and 3,3-dimethyl-2-(3-oxobutyl)cyclobutane-1-carboxylic acid 46 was obtained in $80 \%$ isolated yield as a 1.4:1 mixture of diastereoisomers ( $210.7 \mathrm{mg}, 1.06 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 3.20-3.15(\mathrm{~m}, 0.6 \mathrm{H}), 2.64(\mathrm{q}, J=9.09 \mathrm{~Hz}$, $0.4 \mathrm{H}), 2.47-2.24(\mathrm{~m}, 3 \mathrm{H}), 2.14-2.07(\mathrm{~m}, 4 \mathrm{H}), 1.92-1.66(\mathrm{~m}, 3 \mathrm{H}), 1.09(\mathrm{~s}, 2 \mathrm{H}), 1.04(\mathrm{~s}$, $1.1 \mathrm{H}), 1.02(\mathrm{~s}, 2 \mathrm{H}), 1.01(\mathrm{~s}, 1.1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR for the mixture of diastereoisomers $(126$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 209.26$ (s), 209.24 (s), 181.83 (s), 180.99 (s), 47.76 (s), 46.43 (s), 42.05 (s), 41.28 (s), 39.26 (s), 36.51 (s), 35.94 (s), 35.86 (s), 34.57 (s), 33.93 (s), 31.01 (s), 30.17 (s), 29.96 (s), 29.92 (s), 23.97 (s), 23.26 (s), 22.32 (s), 21.49 (s).

## Methyl 3,3-dimethyl-2-(3-oxobutyl)cyclobutane-1-carboxylate (66)

3,3-Dimethyl-2-(3-oxobutyl)cyclobutane-1-carboxylic acid 46 (76.50 $\mathrm{mg}, 0.39 \mathrm{mmol}$ ) were dissolved in 2 ml of a mixture of toluene:methanol ( $1: 1$ ) under inert conditions. The solution was cooled down to $0{ }^{\circ} \mathrm{C}$ and 2 M trimethylsilyldiazomethane in diethyl ether ( $0.40 \mathrm{ml}, 0.80 \mathrm{mmol}$ ) was added dropwise. The reaction mixture was stirred for 1.5 h and then directly concentrated under vacuum. Methyl 3,3-dimethyl-2-(3-oxobutyl)cyclobutane-1-carboxylate $\mathbf{6 6}$ was obtained in $91 \%$ isolated yield as a 1.1:1 mixture of diastereoisomers ( $75.1 \mathrm{mg}, 0.35 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 3.62(\mathrm{~s}, 1.5 \mathrm{H}), 3.61(\mathrm{~s}, 1.5 \mathrm{H}), 3.15-3.10(\mathrm{~m}$, $0.6 \mathrm{H}), 2.59(\mathrm{q}, J=9.21 \mathrm{~Hz}, 0.5 \mathrm{H}), 2.36-2.19(\mathrm{~m}, 3 \mathrm{H}), 2.09-2.05(\mathrm{~m}, 4 \mathrm{H}), 1.82-1.73$ $(\mathrm{m}, 1 \mathrm{H}), 1.64-1.56(\mathrm{~m}, 2 \mathrm{H}), 1.07(\mathrm{~s}, 1.5 \mathrm{H}), 1.02(\mathrm{~s}, 1.5 \mathrm{H}), 1.00(\mathrm{~s}, 1.5 \mathrm{H}), 0.99(\mathrm{~s}, 1.5 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR for the mixture of diastereoisomers ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 208.52$ (s), 208.40 (s), 175.82 (s), 174.99 (s), 51.59 (s), 51.38 (s), 47.68 (s), 46.34 (s), 41.98 (s), 41.32 (s), 39.24 (s), 36.33 (s), 36.11 (s), 35.69 (s), 34.53 (s), 34.09 (s), 31.04 (s), 30.16 (s), 29.93 (s), 29.89 (s), 24.01 (s), 23.29 (s), 22.30 (s), 21.58 (s).

## Methyl 3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1-carboxylate (71)

Trimethylsilyl trifluoromethanesulfonate ( $18.00 \mu \mathrm{l}, 0.10 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200.00 \mu \mathrm{l})$. Then, 22.00 ml of this solution was added over methyl 3,3-dimethyl-2-(3-oxobutyl)cyclobutane-1carboxylate $66(21.00 \mathrm{mg}, 0.10 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ and under inert conditions followed by 2,2,7,7-tetramethyl-3,6-dioxa-2,7-disilaoctane ( $47.00 \mu 1,0.20 \mathrm{mmol}$ ). The reaction mixture was stirred for 1.5 h and quenched by a drop of pyridine. The solution was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with saturated $\mathrm{NaHCO}_{3}$, aqueous $\mathrm{CuSO}_{4} 1 \%$ and water, sequentially. The organic layers were dried with $\mathrm{NaSO}_{4}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and concentrated. Methyl 3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1-carboxylate $\mathbf{7 1}$ was obtained quantitatively as a 1:1 mixture of diastereoisomers ( $27.4 \mathrm{mg}, 0.10 \mathrm{mmol}$ ). Note: Use 1.2 equiv. of 2,2,7,7-tetramethyl-3,6-dioxa-2,7-disilaoctane a in larger scale otherwise the purification is more complicated. ${ }^{1} \mathrm{H}$ NMR for the mixture of diastereoisomers $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 3.95$ $-3.89(\mathrm{~m}, 4 \mathrm{H}), 3.66(\mathrm{~s}, 1.5 \mathrm{H}), 3.65(\mathrm{~s}, 1.5 \mathrm{H}), 3.20-3.15(\mathrm{~m}, 0.5 \mathrm{H}), 2.64-2.59(\mathrm{~m}, 0.5 \mathrm{H})$, $2.28-2.23(\mathrm{~m}, 0.5 \mathrm{H}), 2.16-2.10(\mathrm{~m}, 1 \mathrm{H}), 1.90-1.86(\mathrm{~m}, 0.5 \mathrm{H}), 1.80-1.76(\mathrm{~m}, 1 \mathrm{H})$,
$1.55-1.45(\mathrm{~m}, 4 \mathrm{H}), 1.30(\mathrm{~s}, 1.5 \mathrm{H}), 1.29(\mathrm{~s}, 1.5 \mathrm{H}), 1.12(\mathrm{~s}, 1.5 \mathrm{H}), 1.08(\mathrm{~s}, 1.5 \mathrm{H}), 1.05(\mathrm{~s}$, $1.5 \mathrm{H}), 1.03(\mathrm{~s}, 1.5 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR for the mixture of diastereoisomers $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 176.10(\mathrm{~s}), 175.33(\mathrm{~s}), 110.09(\mathrm{~s}), 110.04(\mathrm{~s}), 64.78(\mathrm{~s}), 64.75(\mathrm{~s}), 51.69(\mathrm{~s}), 51.40$ (s), 48.47 (s), 47.17 (s), 39.44 (s), 37.70 (s), 36.85 (s), 36.53 (s), 36.10 (s), 35.73 (s), 34.70 (s), 34.12 (s), 31.31 (s), 30.52 (s), 24.91 (s), 23.86 (s), 23.82 (s), 23.44 (s), 22.33 (s), 22.11 (s).

Methyl trans-3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1carboxylate (trans-71)

Methyl 3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1-carboxylate $71(30.00 \mathrm{mg}, 0.12 \mathrm{mmol})$ was dissolved in 0.25 ml of THF under inert conditions and sodium methoxide ( $6.5 \mathrm{mg}, 0.12 \mathrm{mmol}$ ) was added. Then, 0.25 ml of freshly distilled methanol were added and the reaction mixture was stirred at $70^{\circ} \mathrm{C}$ for 20 h , when the diastereoselectivity reached $97: 3$ by GC-MS. The solution was cooled down to $0{ }^{\circ} \mathrm{C}$ and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ followed by extraction with ethyl acetate. The organic layers were washed with saturated $\mathrm{NaHCO}_{3}$ and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under reduced pressure and methyl trans-3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1-carboxylate trans-71 was obtained in $77 \%$ isolated yield ( $22.8 \mathrm{mg}, 0.09 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 3.94-3.90(\mathrm{~m}, 4 \mathrm{H}), 3.65(\mathrm{~s}, 3 \mathrm{H}), 2.61(\mathrm{q}, J=9.09 \mathrm{~Hz}, 1 \mathrm{H}), 2.16-2.11(\mathrm{~m}, 1 \mathrm{H})$, $1.87(\mathrm{~m}, 1 \mathrm{H}), 1.78(\mathrm{dd}, J=11.24,8.71 \mathrm{~Hz}, 1 \mathrm{H}), 1.55-1.45(\mathrm{~m}, 4 \mathrm{H}), 1.30(\mathrm{~s}, 3 \mathrm{H}), 1.07(\mathrm{~s}$, $3 \mathrm{H}), 1.03(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 176.09(\mathrm{~s}), 110.04(\mathrm{~s}), 64.76(\mathrm{~s})$, 51.69 (s), 48.47 ( s), 39.43 (s), 36.84 (s), 36.09 (s), 34.69 (s), 30.51 (s), 24.90 (s), 23.85 (s), 22.32 (s). Stereochemistry confirmed with NOESY experiments (see Chapter 5).

## 1-(3,3-Dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutyl)ethan-1-one (trans73)

Methyl trans-3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutane-1-carboxylate trans-71 ( $10.60 \mathrm{mg}, 41.00 \mu \mathrm{~mol})$ was dissolved in THF ( 0.10 ml ) under inert conditions and $\mathrm{N}, \mathrm{O}$ dimethylhydroxylamine hydrochloride ( $4.50 \mathrm{mg}, 45.10 \mu \mathrm{~mol}$ ) was added. The solution was cooled down to $0{ }^{\circ} \mathrm{C}$ and 2 M isopropylmagnesium chloride in diethyl ether ( $62.00 \mu \mathrm{l}, 123.00$ $\mu \mathrm{mol})$ was added. The reaction mixture was stirred for 2 h and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ followed by extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layers were washed with water and dried with $\mathrm{MgSO}_{4}$. The Weinreb amide intermediate trans-72 was obtained in $81 \%$ yield and used directly. 1-(3,3-Dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutyl)-2-methoxypropan-1-one trans-72 (16.30 mg, $57.00 \mu \mathrm{~mol})$ was dissolved in THF ( 0.20 ml ) under inert conditions and cooled down to $0^{\circ} \mathrm{C}$. Then, 3 M methylmagnesium bromide in diethyl ether ( $35.00 \mu \mathrm{l}, 102.60 \mu \mathrm{~mol}$ ) was added and the solution was stirred for 1.5 h at $25^{\circ} \mathrm{C}$. The reaction was cooled down to $0^{\circ} \mathrm{C}$ and quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ followed by extraction with ethyl acetate. The organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The crude was purified with neutral alumina column chromatography eluting with cyclohexane - cyclohexane:ethyl acetate ( $2: 1$ ) - ethyl acetate to obtain 1-(3,3-dimethyl-2-(2-(2-methyl-1,3-dioxolan-2-yl)ethyl)cyclobutyl)ethan-1-one trans-73 in $65 \%$ isolated yield ( $9.5 \mathrm{mg}, 0.04 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta$ $3.94-3.89(\mathrm{~m}, 4 \mathrm{H}), 2.73(\mathrm{q}, J=9.52 \mathrm{~Hz}, 1 \mathrm{H}), 2.15-2.11(\mathrm{~m}, 1 \mathrm{H}), 2.08(\mathrm{~s}, 3 \mathrm{H}), 1.77(\mathrm{t}, J$
$=9.32 \mathrm{~Hz}, 2 \mathrm{H}), 1.53-1.40(\mathrm{~m}, 4 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}), 1.05(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 210.29$ (s), 110.00 (s), 64.78 (s), 47.59 (s), 47.03 (s), 37.18 (s), 36.25 (s), 33.95 (s), 30.61 (s), 28.47 (s), 25.05 (s), 23.87 (s), 22.59 (s). ESI $^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{14} \mathrm{H}_{24} \mathrm{NaO}_{3}{ }^{+}[\mathrm{M}+\mathrm{Na}]^{+} 263.1618$, found $263.1612(0.6 \mathrm{ppm})$.

## 2,2,6-Trimethyl-6-(phenylethynyl)tetrahydro-2H-pyran (59)

[(S,S,S)-(+)-(3,5-Dioxa-4-phosphacyclohepta[2,1-a:3,4-a']dinaphthalen-4-yl)bis(1-phenylethyl) amine] gold (I) chloride called $\mathbf{Z}(3.1 \mathrm{mg}, 4.02 \mu \mathrm{~mol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.05 \mathrm{ml})$ and added over silver bis(trifluoromethanesulfonyl)imide under inert conditions $(1.5 \mathrm{mg}, 3.87 \mu \mathrm{~mol})$. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 15 min . The suspension was filtered through Teflon 0.22 and then concentrated. The crude was dissolved again in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.15 \mathrm{ml})$ under inert conditions and ethynylbenzene ( $9 \mu$, 0.08 mmol ) followed by 6 -methylhep- $5-\mathrm{en}$ - 2 -one ( $49 \mu 1,0.33 \mathrm{mmol}$ ) were added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 20 h and quenched with a drop of $\mathrm{Et}_{3} \mathrm{~N}$. The crude was concentrated and purified by silica gel preparative TLC eluting with pentane: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (2:1). 2,2,6-Trimethyl-6-(phenylethynyl)tetrahydro-2H-pyran 59 was obtained in $38 \%$ isolated yield ( $8 \mathrm{mg}, 0.04 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 7.41-7.38(\mathrm{~m}, 2 \mathrm{H})$, $7.30-7.27(\mathrm{~m}, 3 \mathrm{H}), 2.13-2.02(\mathrm{~m}, 1 \mathrm{H}), 1.96-1.91(\mathrm{~m}, 1 \mathrm{H}), 1.67-1.61(\mathrm{~m}, 1 \mathrm{H}), 1.54$ $(\mathrm{s}, 3 \mathrm{H}), 1.53(\mathrm{~s}, 3 \mathrm{H}), 1.49-1.34(\mathrm{~m}, 3 \mathrm{H}), 1.22(\mathrm{~s}, 3 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 131.46$ (s), 128.35 (s), 128.00 (s), 123.71 (s), 94.69 (s), 83.46 (s), 73.64 (s), 67.96 (s), $38.68(\mathrm{~s}), 36.76(\mathrm{~s}), 33.30(\mathrm{~s}), 32.69(\mathrm{~s}), 25.55(\mathrm{~s}), 17.96(\mathrm{~s}) . \mathrm{APCI}^{+} \mathrm{m} / \mathrm{z}$ calc for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{O}^{+}$ $[\mathrm{M}+\mathrm{H}]^{+} 229.1587$, found 229.1586 ( 0.1 ppm ).
